# PROCESS FOR REMOVAL OR BLEACHING OF SOILING OR STAINS FROM CELLULOSIC FABRIC

## FIELD OF THE INVENTION

5

The present invention relates to an improved enzymatic process for cleaning fabric or textile, notably cellulosic fabric or textile, particularly for removing or bleaching stains present on cellulosic fabric.

10

## BACKGROUND OF THE INVENTION

15

Enzymatic processes for washing clothes (laundry washing) and other types of fabric or textile have been known for many years.

20

Certain types of soiling or stains have generally been found to be problematical to remove in such washing procedures. These are typically stains originating from starch, proteins, fats, red wine, fruit (such as blackcurrant, cherry, strawberry or tomato), vegetables (such as carrot or beetroot), tea, coffee, spices (such as curry or paprika), body fluids, grass, or ink (e.g. from ball-point pens or fountain pens).

25

30

It is an object of the present invention to improve the performance of a washing enzyme under conventional washing conditions by modifying the enzyme so as to alter (increase) the affinity of the enzyme for cellulosic fabric, whereby the modified enzyme is believed to be able to come into closer contact, and/or more lasting contact, with the soiling or stain in question.

## SUMMARY OF THE INVENTION

35

It has now surprisingly been found possible to achieve improved cleaning of cellulosic fabric or textile, particularly improved removal or bleaching of stains present thereon, by means of an enzymatic process wherein the fabric or textile is contacted with an enzyme which has been modified so as to have increased affinity (relative to the unmodified enzyme) for binding to a cellulosic fabric or textile.

#### DETAILED DESCRIPTION OF THE INVENTION

The present invention thus relates, inter alia, to a process for removal or bleaching of soiling or stains present on cellulosic fabric or textile, wherein the fabric or textile is contacted in aqueous medium with a modified enzyme (enzyme hybrid) which comprises a catalytically (enzymatically) active amino acid sequence of a non-cellulolytic enzyme linked to an amino acid sequence comprising a cellulose-binding domain.

#### Stains

Soiling or stains which may be removed according to the present invention include those already mentioned above, i.e. soiling or stains originating from, for example, starch, proteins, fats, red wine, fruit [such as blackcurrant, cherry, strawberry or tomato (in particular tomato in ketchup or spaghetti sauce)], vegetables (such as carrot or beetroot), tea, coffee, spices (such as curry or paprika), body fluids, grass, or ink (e.g. from ball-point pens or fountain pens). Other types of soiling or stains which are appropriate targets for removal or bleaching in accordance with the invention include sebum, soil (i.e. earth), clay, oil and paint.

#### Cellulosic fabric

The term "cellulosic fabric" is intended to indicate any type of fabric, in particular woven fabric, prepared from a cellulose-containing material, such as cotton, or from a cellulose-

derived material (prepared, e.g., from wood pulp or from cotton).

In the present context, the term "fabric" is intended to include garments and other types of processed fabrics, and is used interchangeably with the term "textile".

Examples of cellulosic fabric manufactured from naturally occurring cellulosic fibre are cotton, ramie, jute and flax (linen) fabrics. Examples of cellulosic fabrics made from man-made cellulosic fibre are viscose (rayon) and lyocell (e.g. Tencel™) fabric; also of relevance in the context of the invention are all blends of cellulosic fibres (such as viscose, lyocell, cotton, ramie, jute or flax) with other fibres, e.g. with animal hair fibres such as wool, alpaca or camel hair, or with polymer fibres such as polyester, polyacrylic, polyamide or polyacetate fibres.

Specific examples of blended cellulosic fabric are viscose/-cotton blends, lyocell/cotton blends (e.g. Tencel™/cotton blends), viscose/wool blends, lyocell/wool blends, cotton/wool blends, cotton/polyester blends, viscose/cotton/polyester blends, wool/cotton/polyester blends, and flax/cotton blends.

#### 25 Cellulose-binding domains

Although a number of types of carbohydrate-binding domains have been described in the patent and scientific literature, the majority thereof - many of which derive from cellulolytic enzymes (cellulases) - are commonly referred to as "cellulose-binding domains"; a typical cellulose-binding domain (CBD) will thus be one which occurs in a cellulase and which binds preferentially to cellulose and/or to poly- or oligosaccharide fragments thereof.

Cellulose-binding (and other carbohydrate-binding) domains are polypeptide amino acid sequences which occur as integral parts of large polypeptides or proteins consisting of two or more polypeptide amino acid sequence regions, especially in hydrolytic enzymes (hydrolases) which typically comprise a catalytic domain containing the active site for substrate hydrolysis and a carbohydrate-binding domain for binding to the carbohydrate substrate in question. Such enzymes can comprise more than one catalytic domain and one, two or three carbohydrate-binding domains, and they may further comprise one or more polypeptide amino acid sequence regions linking the carbohydrate-binding domain(s) with the catalytic domain(s), a region of the latter type usually being denoted a "linker".

Examples of hydrolytic enzymes comprising a cellulose-binding domain are cellulases, xylanases, mannanases, arabinofuranosidases, acetylerases and chitinases. "Cellulose-binding domains" have also been found in algae, e.g. in the red alga *Porphyra purpurea* in the form of a non-hydrolytic polysaccharide-binding protein [see P. Tomme et al., Cellulose-Binding Domains - Classification and Properties in Enzymatic Degradation of Insoluble Carbohydrates, John N. Saddler and Michael H. Penner (Eds.), ACS Symposium Series, No. 618 (1996)]. However, most of the known CBDs [which are classified and referred to by P. Tomme et al. (op cit.) as "cellulose-binding domains"] derive from cellulases and xylanases.

In the present context, the term "cellulose-binding domain" is intended to be understood in the same manner as in the latter reference (P. Tomme et al., op. cit). The P. Tomme et al. reference classifies more than 120 "cellulose-binding domains" into 10 families (I-X) which may have different functions or roles in connection with the mechanism of

substrate binding. However, it is to be anticipated that new family representatives and additional families will appear in the future, and in connection with the present invention a representative of one such new CBD family has in fact been identified (see Example 2 herein).

In proteins/polypeptides in which CBDs occur (e.g. enzymes, typically hydrolytic enzymes such as cellulases), a CBD may be located at the N or C terminus or at an internal position.

That part of a polypeptide or protein (e.g. hydrolytic enzyme) which constitutes a CBD *per se* typically consists of more than about 30 and less than about 250 amino acid residues. For example: those CBDs listed and classified in Family I in accordance with P. Tomme et al. (*op. cit.*) consist of 33-37 amino acid residues, those listed and classified in Family IIa consist of 95-108 amino acid residues, those listed and classified in Family VI consist of 85-92 amino acid residues, whilst one CBD (derived from a cellulase from *Clostridium thermocellum*) listed and classified in Family VII consists of 240 amino acid residues. Accordingly, the molecular weight of an amino acid sequence constituting a CBD *per se* will typically be in the range of from about 4kD to about 40kD, and usually below about 35kD.

#### Enzyme hybrids

Enzyme classification numbers (EC numbers) referred to in the present specification with claims are in accordance with the Recommendations (1992) of the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology, Academic Press Inc., 1992.

A modified enzyme (enzyme hybrid) for use in accordance with the invention comprises a catalytically active (enzymatically

active) amino acid sequence (in general a polypeptide amino acid sequence) of a non-cellulolytic enzyme (i.e. a catalytically active amino acid sequence of an enzyme other than a cellulase) useful in relation to the cleaning of fabric or textile (typically the removal or bleaching of soiling or stains from fabrics or textiles in washing processes), in particular of an enzyme selected from the group consisting of amylases (e.g.  $\alpha$ -amylases, EC 3.2.1.1), proteases (i.e. peptidases, EC 3.4), lipases (e.g. triacylglycerol lipases, EC 3.1.1.3) and oxidoreductases (e.g. peroxidases, EC 1.11.1, such as those classified under EC 1.11.1.7; or phenol-oxidizing oxidases, such as laccases, EC 1.10.3.2, or other enzymes classified under EC 1.10.3), fused (linked) to an amino acid sequence comprising a cellulose-binding domain. The catalytically active amino acid sequence in question may comprise or consist of the whole of - or substantially the whole of - the full amino acid sequence of the mature enzyme in question, or it may consist of a portion of the full sequence which retains substantially the same catalytic (enzymatic) properties as the full sequence.

Modified enzymes (enzyme hybrids) of the type in question, as well as detailed descriptions of the preparation and purification thereof, are known in the art [see, e.g., WO 90/00609, WO 94/24158 and WO 95/16782, as well as Greenwood et al., Biotechnology and Bioengineering 44 (1994) pp. 1295-1305]. They may, e.g., be prepared by transforming into a host cell a DNA construct comprising at least a fragment of DNA encoding the cellulose-binding domain ligated, with or without a linker, to a DNA sequence encoding the enzyme of interest, and growing the transformed host cell to express the fused gene. One relevant, but non-limiting, type of recombinant product (enzyme hybrid) obtainable in this manner - often referred to in the art as a "fusion protein" - may be described by one of the following general formulae:

A-CBD-MR-X-B

A-X-MR-CBD-B

5

In the latter formulae, CBD is an amino acid sequence comprising at least the cellulose-binding domain (CBD) *per se*.

10 MR (the middle region; a linker) may be a bond, or a linking group comprising from 1 to about 100 amino acid residues, in particular of from 2 to 40 amino acid residues, e.g. from 2 to 15 amino acid residues. MR may, in principle, alternatively be a non-amino-acid linker.

15 X is an amino acid sequence comprising the above-mentioned, catalytically (enzymatically) active sequence of amino acid residues of a polypeptide encoded by a DNA sequence encoding the non-cellulolytic enzyme of interest.

20 The moieties A and B are independently optional. When present, a moiety A or B constitutes a terminal extension of a CBD or X moiety, and normally comprises one or more amino acid residues.

25 It will thus, *inter alia*, be apparent from the above that a CBD in an enzyme hybrid of the type in question may be positioned C-terminally, N-terminally or internally in the enzyme hybrid. Correspondingly, an X moiety in an enzyme hybrid of the type in question may be positioned N-terminally,  
30 C-terminally or internally in the enzyme hybrid.

Enzyme hybrids of interest in the context of the invention include enzyme hybrids which comprise more than one CBD, e.g. such that two or more CBDs are linked directly to each other,  
35 or are separated from one another by means of spacer or linker

sequences (consisting typically of a sequence of amino acid residues of appropriate length). Two CBDs in an enzyme hybrid of the type in question may, for example, also be separated from one another by means of an -MR-X- moiety as defined  
5 above.

A very important issue in the construction of enzyme hybrids of the type in question is the stability towards proteolytic degradation. Two- and multi-domain proteins are particularly  
10 susceptible towards proteolytic cleavage of linker regions connecting the domains. Proteases causing such cleavage may, for example, be subtilisins, which are known to often exhibit broad substrate specificities [see, e.g.: Grøn et al., Biochemistry 31 (1992), pp. 6011-6018; Teplyakov et al.,  
15 Protein Engineering 5 (1992), pp. 413-420].

Glycosylation of linker residues in eukaryotes is one of Nature's ways of preventing proteolytic degradation. Another is to employ amino acids which are less favoured by the  
20 surrounding proteases. The length of the linker also plays a role in relation to accessibility by proteases. Which "solution" is optimal depends on the environment in which the enzyme hybrid is to function.

25 When constructing new enzyme hybrid molecules, linker stability thus becomes an issue of great importance. The various linkers described in examples presented herein (*vide infra*) in the context of the present invention are intended to take account  
30 of this issue.

Cellulases (cellulase genes) useful for preparation of CBDs  
Techniques suitable for isolating a cellulase gene are well known in the art. In the present context, the terms  
35 "cellulase" and "cellulolytic enzyme" refer to an enzyme which

catalyses the degradation of cellulose to glucose, cellobiose, triose and/or other cello-oligosaccharides.

Preferred cellulases (i.e. cellulases comprising preferred  
5 CBDs) in the present context are microbial cellulases, particularly bacterial or fungal cellulases. Endoglucanases, notably endo-1,4- $\beta$ -glucanases (EC 3.2.1.4), particularly monocomponent (recombinant) endo-1,4- $\beta$ -glucanases, are a preferred class of cellulases,.

10

Useful examples of bacterial cellulases are cellulases derived from or producible by bacteria from the group consisting of *Pseudomonas*, *Bacillus*, *Cellulomonas*, *Clostridium*, *Microspora*, *Thermotoga*, *Caldocellum* and Actinomycets such as *Streptomyces*,  
15 *Termomonospora* and *Acidothemus*, in particular from the group consisting of *Pseudomonas cellulolyticus*, *Bacillus lautus*, *Cellulomonas fimi*, *Clostridium thermocellum*, *Microspora bispora*, *Termomonospora fusca*, *Termomonospora cellulolyticum* and *Acidothemus cellulolyticus*.

20

The cellulase may be an acid, a neutral or an alkaline cellulase, i.e. exhibiting maximum cellulolytic activity in the acid, neutral or alkaline range, respectively.

25 A useful cellulase is an acid cellulase, preferably a fungal acid cellulase, which is derived from or producible by fungi from the group of genera consisting of *Trichoderma*, *Myrothecium*, *Aspergillus*, *Phanaerochaete*, *Neurospora*, *Neocallimastix* and *Botrytis*.

30

A preferred useful acid cellulase is one derived from or producible by fungi from the group of species consisting of *Trichoderma viride*, *Trichoderma reesei*, *Trichoderma longibrachiatum*, *Myrothecium verrucaria*, *Aspergillus niger*, *Aspergil-*

*lus oryzae*, *Phanaerochaete chrysosporium*, *Neurospora crassa*, *Neocallimastix partriciarum* and *Botrytis cinerea*.

Another useful cellulase is a neutral or alkaline cellulase, preferably a fungal neutral or alkaline cellulase, which is derived from or producible by fungi from the group of genera consisting of *Aspergillus*, *Penicillium*, *Myceliophthora*, *Humicola*, *Irpex*, *Fusarium*, *Stachybotrys*, *Scopulariopsis*, *Chaetomium*, *Mycogone*, *Verticillium*, *Myrothecium*, *Papulospora*, *Gliocladium*, *Cephalosporium* and *Acremonium*.

A preferred alkaline cellulase is one derived from or producible by fungi from the group of species consisting of *Humicola insolens*, *Fusarium oxysporum*, *Myceliophthora thermophila*, *Penicillium janthinellum* and *Cephalosporium* sp., preferably from the group of species consisting of *Humicola insolens* DSM 1800, *Fusarium oxysporum* DSM 2672, *Myceliophthora thermophila* CBS 117.65, and *Cephalosporium* sp. RYM-202.

A preferred cellulase is an alkaline endoglucanase which is immunologically reactive with an antibody raised against a highly purified ~43kD endoglucanase derived from *Humicola insolens* DSM 1800, or which is a derivative of the latter ~43kD endoglucanase and exhibits cellulase activity.

Other examples of useful cellulases are variants of parent cellulases of fungal or bacterial origin, e.g. variants of a parent cellulase derivable from a strain of a species within one of the fungal genera *Humicola*, *Trichoderma* or *Fusarium*.

#### Isolation of a cellulose-binding domain

In order to isolate a cellulose-binding domain of, e.g., a cellulase, several genetic engineering approaches may be used. One method uses restriction enzymes to remove a portion of the

gene and then to fuse the remaining gene-vector fragment in frame to obtain a mutated gene that encodes a protein truncated for a particular gene fragment. Another method involves the use of exonucleases such as *Bal31* to systematically delete nucleotides either externally from the 5' and the 3' ends of the DNA or internally from a restricted gap within the gene. These gene-deletion methods result in a mutated gene encoding a shortened gene molecule whose expression product may then be evaluated for substrate-binding (e.g. cellulose-binding) ability. Appropriate substrates for evaluating the binding ability include cellulosic materials such as Avicel™ and cotton fibres. Other methods include the use of a selective or specific protease capable of cleaving a CBD, e.g. a terminal CBD, from the remainder of the polypeptide chain of the protein in question

As already indicated (*vide supra*), once a nucleotide sequence encoding the substrate-binding (carbohydrate-binding) region has been identified, either as cDNA or chromosomal DNA, it may then be manipulated in a variety of ways to fuse it to a DNA sequence encoding the enzyme or enzymatically active amino acid sequence of interest. The DNA fragment encoding the carbohydrate-binding amino acid sequence, and the DNA encoding the enzyme or enzymatically active amino acid sequence of interest are then ligated with or without a linker. The resulting ligated DNA may then be manipulated in a variety of ways to achieve expression. Preferred microbial expression hosts include certain *Aspergillus* species (e.g. *A. niger* or *A. oryzae*), *Bacillus* species, and organisms such as *Escherichia coli* or *Saccharomyces cerevisiae*.

#### Amylolytic enzymes

Amylases (e.g.  $\alpha$ - or  $\beta$ -amylases) which are appropriate as the basis for enzyme hybrids of the types employed in the context

of the present invention include those of bacterial or fungal origin. Chemically or genetically modified mutants of such amylases are included in this connection. Relevant  $\alpha$ -amylases include, for example,  $\alpha$ -amylases obtainable from *Bacillus* species, in particular a special strain of *B. licheniformis*, described in more detail in GB 1296839. Relevant commercially available amylases include Duramyl™, Termamyl™, Fungamyl™ and BAN™ (all available from Novo Nordisk A/S, Bagsvaerd, Denmark), and Rapidase™ and Maxamyl™ P (available from Gist-Brocades, Holland).

Other useful amylolytic enzymes are CGTases (cyclodextrin glucanotransferases, EC 2.4.1.19), e.g. those obtainable from species of *Bacillus*, *Thermoanaerobactor* or *Thermoanaerobacterium*.

#### Proteolytic enzymes

Proteases (peptidases) which are appropriate as the basis for enzyme hybrids of the types employed in the context of the present invention include those of animal, vegetable or microbial origin. Proteases of microbial origin are preferred. Chemically or genetically modified mutants of such proteases are included in this connection. The protease may be a serine protease, preferably an alkaline microbial protease or a trypsin-like protease. Examples of alkaline proteases are subtilisins, especially those derived from *Bacillus*, e.g., subtilisin Novo, subtilisin Carlsberg, subtilisin 309, subtilisin 147 and subtilisin 168 (described in WO 89/06279). Examples of trypsin-like proteases are trypsin (e.g. of porcine or bovine origin) and the Fusarium protease described in WO 89/06270.

Relevant commercially available protease enzymes include

Alcalase<sup>TM</sup>, Savinase<sup>TM</sup>, Primase, Durazym<sup>TM</sup> and Esperase<sup>TM</sup> (all available from Novo Nordisk A/S, Bagsvaerd, Denmark), Maxatase<sup>TM</sup>, Maxacal<sup>TM</sup>, Maxapem<sup>TM</sup> and Properase<sup>TM</sup> (available from Gist-Brocades, Holland), Purafect<sup>TM</sup> and Purafect<sup>TM</sup> OXP  
5 (available from Genencor International), and Opticlean<sup>TM</sup> and Optimase<sup>TM</sup> (available from by Solvay Enzymes).

#### Lipolytic enzymes

10 Lipolytic enzymes (lipases) which are appropriate as the basis for enzyme hybrids of the types employed in the context of the present invention include those of bacterial or fungal origin. Chemically or genetically modified mutants of such lipases are included in this connection.

15 Examples of useful lipases include a *Humicola lanuginosa* lipase, e.g. as described in EP 258 068 and EP 305 216; a *Rhizomucor miehei* lipase, e.g. as described in EP 238 023; a *Candida* lipase, such as a *C. antarctica* lipase, e.g. the *C. antarctica* lipase A or B described in EP 214 761; a  
20 *Pseudomonas* lipase, such as one of those described in EP 721 981 (e.g. a lipase obtainable from a *Pseudomonas* sp. SD705 strain having deposit accession number FERM BP-4772), in PCT/JP96/00426, in PCT/JP96/00454 (e.g. a *P. solanacearum* lipase), in EP 571 982 or in WO 95/14783 (e.g. a *P. mendocina* lipase), a *P. alcaligenes* or *P. pseudoalcaligenes* lipase, e.g.  
25 as described in EP 218 272; a *P. cepacia* lipase, e.g. as described in EP 331 376, a *P. stutzeri* lipase, e.g. as disclosed in GB 1,372,034, or a *P. fluorescens* lipase; a *Bacillus* lipase, e.g. a *B. subtilis* lipase [Dartois et al.,  
30 Biochemica et Biophysica Acta 1131 (1993) pp. 253-260], a *E. stearothermophilus* lipase (JP 64/744992) and a *B. pumilus* lipase (WO 91/16422).

Furthermore, a number of cloned lipases may be useful, including the *Penicillium camembertii* lipase described by Yamaguchi et al. in Gene 103 (1991), pp. 61-67, the *Geotricum candidum* lipase [Y. Shimada et al., J. Biochem. 106 (1989), pp. 383-388], and various *Rhizopus* lipases such as an *R. delemar* lipase [M.J. Hass et al., Gene 109 (1991) pp. 117-113], an *R. niveus* lipase [Kugimiya et al., Biosci. Biotech. Biochem. 56 (1992), pp. 716-719] and a *R. oryzae* lipase.

Other potentially useful types of lipolytic enzymes include cutinases, e.g. a cutinase derived from *Pseudomonas mendocina* as described in WO 88/09367, or a cutinase derived from *Fusarium solani* f. *pisi* (described, e.g., in WO 90/09446).

Suitable commercially available lipases include Lipolase™ and Lipolase Ultra™ (available from Novo Nordisk A/S), M1 Lipase™, Lumafast™ and Lipomax™ (available from Gist-Brocardes) and Lipase P "Amano" (available from Amano Pharmaceutical Co. Ltd.).

#### Oxidoreductases

Oxidoreductases which are appropriate as the basis for enzyme hybrids of the types employed in the context of the present invention include peroxidases (EC 1.11.1) and oxidases, such as laccases (EC 1.10.3.2) and certain related enzymes.

#### Peroxidases

Peroxidases (EC 1.11.1) are enzymes acting on a peroxide (e.g. hydrogen peroxide) as acceptor. Very suitable peroxidases are those classified under EC 1.11.1.7, or any fragment derived therefrom, exhibiting peroxidase activity. Synthetic or semisynthetic derivatives thereof (e.g. with porphyrin ring

systems, or microperoxidases, cf., for example, US 4,077,768, EP 537 381, WO 91/05858 and WO 92/16634) may also be of value in the context of the invention.

5 Very suitable peroxidases are peroxidases obtainable from plants (e.g. horseradish peroxidase or soy bean peroxidase) or from microorganisms, such as fungi or bacteria. In this respect, some preferred fungi include strains belonging to the subdivision Deuteromycotina, class Hyphomycetes, e.g. *Fu-*  
10 *sarium*, *Humicola*, *Trichoderma*, *Myrothecium*, *Verticillum*, *Arthromyces*, *Caldariomyces*, *Ulocladium*, *Embellisia*, *Cladosporium* or *Dreschlera*, in particular *Fusarium oxysporum* (DSM 2672), *Humicola insolens*, *Trichoderma resii*, *Myrothecium verrucana* (IFO 6113), *Verticillum alboatrum*, *Verticillum*  
15 *dahliae*, *Arthromyces ramosus* (FERM P-7754), *Caldariomyces fumago*, *Ulocladium chartarum*, *Embellisia alli* or *Dreschlera halodes*.

Other preferred fungi include strains belonging to the sub-  
20 division Basidiomycotina, class Basidiomycetes, e.g. *Coprinus*, *Phanerochaete*, *Coriolus* or *Trametes*, in particular *Coprinus cinereus* f. *microsporus* (IFO 8371), *Coprinus macrorrhizus*, *Phanerochaete chrysosporium* (e.g. NA-12) or *Trametes versicolor* (e.g. PR4 28-A).

25 Further preferred fungi include strains belonging to the subdivision Zygomycotina, class Mycoraceae, e.g. *Rhizopus* or *Mucor*, in particular *Mucor hiemalis*.

30 Some preferred bacteria include strains of the order Actinomycetales, e.g. *Streptomyces spheroides* (ATTC 23965), *Streptomyces thermoviolaceus* (IFO 12382) or *Streptoverticillum verticillium* ssp. *verticillium*.

Other preferred bacteria include *Bacillus pumilus* (ATCC 12905), *Bacillus stearothermophilus*, *Rhodobacter sphaeroides*, *Rhodomonas palustri*, *Streptococcus lactis*, *Pseudomonas*  
5 *purrocinia* (ATCC 15958) or *Pseudomonas fluorescens* (NRRL B-11).

Further preferred bacteria include strains belonging to *Myxococcus*, e.g. *M. virescens*.

10

Other potential sources of useful particular peroxidases are listed in B.C. Saunders et al., *Peroxidase*, London 1964, pp. 41-43.

15 The peroxidase may furthermore be one which is producible by a method comprising cultivating a host cell - transformed with a recombinant DNA vector which carries a DNA sequence encoding said peroxidase as well as DNA sequences encoding functions  
20 permitting the expression of the DNA sequence encoding the peroxidase - in a culture medium under conditions permitting the expression of the peroxidase, and recovering the peroxidase from the culture.

A suitable recombinantly produced peroxidase is a peroxidase  
25 derived from a *Coprinus* sp., in particular *C. macrorrhizus* or *C. cinereus* according to WO 92/16634, or a variant thereof, e.g. a variant as described in WO 94/12621.

#### Oxidases and related enzymes

30 preferred oxidases in the context of the present invention are oxidases classified under EC 1.10.3, which are oxidases employing molecular oxygen as acceptor (i.e. enzymes catalyzing oxidation reactions in which molecular oxygen functions as oxidizing agent).

As indicated above, laccases (EC 1.10.3.2) are very suitable oxidases in the context of the invention. Examples of other useful oxidases in the context of the invention include the catechol oxidases (EC 1.10.3.1) and bilirubin oxidases (EC 1.3.3.5). Further useful, related enzymes include monophenol monooxygenases (EC 1.14.18.1).

Laccases are obtainable from a variety of plant and microbial sources, notably from bacteria and fungi (including filamentous fungi and yeasts), and suitable examples of laccases are to found among those obtainable from fungi, including laccases obtainable from strains of *Aspergillus*, *Neurospora* (e.g. *N. crassa*), *Podospora*, *Botrytis*, *Collybia*, *Fomes*, *Lentinus*, *Pleurotus*, *Trametes* (e.g. *T. villosa* or *T. versicolor* [some species/strains of *Trametes* being known by various names and/or having previously been classified within other genera; e.g. *Trametes villosa* = *T. pinsitus* = *Polyporus pinsitis* (also known as *P. pinsitus* or *P. villosus*) = *Coriolus pinsitus*], *Polyporus*, *Rhizoctonia* (e.g. *R. solani*), *Coprinus* (e.g. *C. plicatilis* or *C. cinereus*), *Psatyrella*, *Myceliophthora* (e.g. *M. thermophila*), *Schytalidium*, *Phlebia* (e.g. *P. radita*; see WO 92/01046), *Coriolus* (e.g. *C. hirsutus*; see JP 2-238885), *Pyricularia* or *Rigidoporus*.

Preferred laccases in the context of the invention include laccase obtainable from species/strains of *Trametes* (e.g. *T. villosa*), *Myceliophthora* (e.g. *M. thermophila*), *Schytalidium* or *Polyporus*.

#### Other enzymes

Further classes of enzymes which are appropriate as the basis for enzyme hybrids of the types employed in the context of the

present invention include pectinases (polygalacturonases; EC 3.2.1.15).

#### Plasmids

5 Preparation of plasmids capable of expressing fusion proteins having the amino acid sequences derived from fragments of more than one polypeptide is well known in the art (see, for example, WO 90/00609 and WO 95/16782). The expression cassette may be included within a replication system for episomal  
10 maintenance in an appropriate cellular host or may be provided without a replication system, where it may become integrated into the host genome. The DNA may be introduced into the host in accordance with known techniques such as transformation, microinjection or the like.

15

Once the fused gene has been introduced into the appropriate host, the host may be grown to express the fused gene. Normally it is desirable additionally to add a signal sequence which provides for secretion of the fused gene. Typical  
20 examples of useful fused genes are:

Signal sequence -- (pro-peptide) -- carbohydrate-binding domain -- linker -- enzyme sequence of interest, or

25 Signal sequence -- (pro-peptide) -- enzyme sequence of interest -- linker -- carbohydrate-binding domain,

in which the pro-peptide sequence normally contains 5-100, e.g. 5-25, amino acid residues.

30

The recombinant product may be glycosylated or non-glycosylated.

#### Detergent compositions

35

Surfactant system

The detergent compositions according to the present invention comprise a surfactant system, wherein the surfactant can be selected from nonionic and/or anionic and/or cationic and/or  
5 ampholytic and/or zwitterionic and/or semi-polar surfactants.

The surfactant is typically present at a level from 0.1% to 60% by weight. The surfactant is preferably formulated to be compatible with enzyme hybrid and enzyme components present  
10 in the composition. In liquid or gel compositions the surfactant is most preferably formulated in such a way that it promotes, or at least does not degrade, the stability of any enzyme hybrid or enzyme in these compositions.

15 Suitable systems for use according to the present invention comprise as a surfactant one or more of the nonionic and/or anionic surfactants described herein.

Polyethylene, polypropylene, and polybutylene oxide condensates of alkyl phenols are suitable for use as the nonionic  
20 surfactant of the surfactant systems of the present invention, with the polyethylene oxide condensates being preferred. These compounds include the condensation products of alkyl phenols having an alkyl group containing from about 6  
25 to about 14 carbon atoms, preferably from about 8 to about 14 carbon atoms, in either a straight chain or branched-chain configuration with the alkylene oxide. In a preferred embodiment, the ethylene oxide is present in an amount equal to from about 2 to about 25 moles, more preferably from about  
30 3 to about 15 moles, of ethylene oxide per mole of alkyl phenol. Commercially available nonionic surfactants of this type include Igepal™ CO-630, marketed by the GAF Corporation; and Triton™ X-45, X-114, X-100 and X-102, all marketed by the Rohm & Haas Company. These surfactants are commonly referred  
35 to as alkylphenol alkoxylates (e.g., alkyl phenol

ethoxylates).

The condensation products of primary and secondary aliphatic alcohols with about 1 to about 25 moles of ethylene oxide are suitable for use as the nonionic surfactant of the nonionic surfactant systems of the present invention. The alkyl chain of the aliphatic alcohol can either be straight or branched, primary or secondary, and generally contains from about 8 to about 22 carbon atoms. Preferred are the condensation products of alcohols having an alkyl group containing from about 8 to about 20 carbon atoms, more preferably from about 10 to about 18 carbon atoms, with from about 2 to about 10 moles of ethylene oxide per mole of alcohol. About 2 to about 7 moles of ethylene oxide and most preferably from 2 to 5 moles of ethylene oxide per mole of alcohol are present in said condensation products. Examples of commercially available nonionic surfactants of this type include Tergitol™ 15-S-9 (The condensation product of  $C_{11}$ - $C_{15}$  linear alcohol with 9 moles ethylene oxide), Tergitol™ 24-L-6 NMW (the condensation product of  $C_{12}$ - $C_{14}$  primary alcohol with 6 moles ethylene oxide with a narrow molecular weight distribution), both marketed by Union Carbide Corporation; Neodol™ 45-9 (the condensation product of  $C_{14}$ - $C_{15}$  linear alcohol with 9 moles of ethylene oxide), Neodol™ 23-3 (the condensation product of  $C_{12}$ - $C_{13}$  linear alcohol with 3.0 moles of ethylene oxide), Neodol™ 45-7 (the condensation product of  $C_{14}$ - $C_{15}$  linear alcohol with 7 moles of ethylene oxide), Neodol™ 45-5 (the condensation product of  $C_{14}$ - $C_{15}$  linear alcohol with 5 moles of ethylene oxide) marketed by Shell Chemical Company, Kyro™ EOB (the condensation product of  $C_{13}$ - $C_{15}$  alcohol with 9 moles ethylene oxide), marketed by The Procter & Gamble Company, and Genapol LA 050 (the condensation product of  $C_{12}$ - $C_{14}$  alcohol with 5 moles of ethylene oxide) marketed by Hoechst. Preferred range of HLB in these products is from 8-11 and most preferred from 8-10.

Also useful as the nonionic surfactant of the surfactant systems of the present invention are alkylpolysaccharides disclosed in US 4,565,647, having a hydrophobic group  
5 containing from about 6 to about 30 carbon atoms, preferably from about 10 to about 16 carbon atoms and a polysaccharide, e.g. a polyglycoside, hydrophilic group containing from about 1.3 to about 10, preferably from about 1.3 to about 3, most preferably from about 1.3 to about 2.7 saccharide units. Any  
10 reducing saccharide containing 5 or 6 carbon atoms can be used, e.g., glucose, galactose and galactosyl moieties can be substituted for the glucosyl moieties (optionally the hydrophobic group is attached at the 2-, 3-, 4-, etc. positions thus giving a glucose or galactose as opposed to a  
15 glucoside or galactoside). The intersaccharide bonds can be, e.g., between the one position of the additional saccharide units and the 2-, 3-, 4-, and/or 6- positions on the preceding saccharide units.

20 The preferred alkylpolyglycosides have the formula

wherein  $R^2$  is selected from the group consisting of alkyl,  
25 alkylphenyl, hydroxyalkyl, hydroxyalkylphenyl, and mixtures thereof in which the alkyl groups contain from about 10 to about 18, preferably from about 12 to about 14, carbon atoms; n is 2 or 3, preferably 2; t is from 0 to about 10, preferably 0; and x is from about 1.3 to about 10, preferably  
30 from about 1.3 to about 3, most preferably from about 1.3 to about 2.7. The glycosyl is preferably derived from glucose. To prepare these compounds, the alcohol or alkylpolyethoxy alcohol is formed first and then reacted with glucose, or a source of glucose, to form the glucoside (attachment at the  
35 1-position). The additional glycosyl units can then be

attached between their 1-position and the preceding glycosyl units 2-, 3-, 4-, and/or 6-position, preferably predominantly the 2-position.

5 The condensation products of ethylene oxide with a hydrophobic base formed by the condensation of propylene oxide with propylene glycol are also suitable for use as the additional nonionic surfactant systems of the present invention. The hydrophobic portion of these compounds will  
10 preferably have a molecular weight from about 1500 to about 1800 and will exhibit water insolubility. The addition of polyoxyethylene moieties to this hydrophobic portion tends to increase the water solubility of the molecule as a whole, and the liquid character of the product is retained up to the  
15 point where the polyoxyethylene content is about 50% of the total weight of the condensation product, which corresponds to condensation with up to about 40 moles of ethylene oxide. Examples of compounds of this type include certain of the commercially available Pluronic™ surfactants, marketed by  
20 BASF.

Also suitable for use as the nonionic surfactant of the nonionic surfactant system of the present invention, are the condensation products of ethylene oxide with the product  
25 resulting from the reaction of propylene oxide and ethylenediamine. The hydrophobic moiety of these products consists of the reaction product of ethylenediamine and excess propylene oxide, and generally has a molecular weight of from about 2500 to about 3000. This hydrophobic moiety is  
30 condensed with ethylene oxide to the extent that the condensation product contains from about 40% to about 80% by weight of polyoxyethylene and has a molecular weight of from about 5,000 to about 11,000. Examples of this type of nonionic surfactant include certain of the commercially  
35 available Tetronic™ compounds, marketed by BASF.

Preferred for use as the nonionic surfactant of the surfactant systems of the present invention are polyethylene oxide condensates of alkyl phenols, condensation products of primary and secondary aliphatic alcohols with from about 1 to about 25 moles of ethyleneoxide, alkylpolysaccharides, and mixtures hereof. Most preferred are C<sub>8</sub>-C<sub>14</sub> alkyl phenol ethoxylates having from 3 to 15 ethoxy groups and C<sub>8</sub>-C<sub>18</sub> alcohol ethoxylates (preferably C<sub>10</sub> avg.) having from 2 to 10 ethoxy groups, and mixtures thereof.

Highly preferred nonionic surfactants are polyhydroxy fatty acid amide surfactants of the formula

wherein R<sup>1</sup> is H, or R<sup>1</sup> is C<sub>1-4</sub> hydrocarbyl, 2-hydroxyethyl, 2-hydroxypropyl or a mixture thereof, R<sup>2</sup> is C<sub>5-31</sub> hydrocarbyl, and Z is a polyhydroxyhydrocarbyl having a linear hydrocarbyl chain with at least 3 hydroxyls directly connected to the chain, or an alkoxyated derivative thereof. Preferably, R<sup>1</sup> is methyl, R<sup>2</sup> is straight C<sub>11-15</sub> alkyl or C<sub>16-18</sub> alkyl or alkenyl chain such as coconut alkyl or mixtures thereof, and Z is derived from a reducing sugar such as glucose, fructose, maltose or lactose, in a reductive amination reaction.

Highly preferred anionic surfactants include alkyl alkoxyated sulfate surfactants. Examples hereof are water soluble salts or acids of the formula RO(A)<sub>m</sub>SO<sub>3</sub>M wherein R is an unsubstituted C<sub>10</sub>-C<sub>24</sub> alkyl or hydroxyalkyl group having a C<sub>10</sub>-C<sub>24</sub> alkyl component, preferably a C<sub>12</sub>-C<sub>20</sub> alkyl or hydroxyalkyl, more preferably C<sub>12</sub>-C<sub>18</sub> alkyl or hydroxyalkyl, A is an ethoxy or propoxy unit, m is greater than zero, typically

between about 0.5 and about 6, more preferably between about 0.5 and about 3, and M is H or a cation which can be, for example, a metal cation (e.g., sodium, potassium, lithium, calcium, magnesium, etc.), ammonium or substituted-ammonium cation. Alkyl ethoxylated sulfates as well as alkyl propoxylated sulfates are contemplated herein. Specific examples of substituted ammonium cations include methyl-, dimethyl, trimethyl-ammonium cations and quaternary ammonium cations such as tetramethyl-ammonium and dimethyl piperdinium cations and those derived from alkylamines such as ethylamine, diethylamine, triethylamine, mixtures thereof, and the like. Exemplary surfactants are  $C_{12}$ - $C_{18}$  alkyl polyethoxylate (1.0) sulfate ( $C_{12}$ - $C_{18}E(1.0)M$ ),  $C_{12}$ - $C_{18}$  alkyl polyethoxylate (2.25) sulfate ( $C_{12}$ - $C_{18}(2.25)M$ ), and  $C_{12}$ - $C_{18}$  alkyl polyethoxylate (3.0) sulfate ( $C_{12}$ - $C_{18}E(3.0)M$ ), and  $C_{12}$ - $C_{18}$  alkyl polyethoxylate (4.0) sulfate ( $C_{12}$ - $C_{18}E(4.0)M$ ), wherein M is conveniently selected from sodium and potassium. Suitable anionic surfactants to be used are alkyl ester sulfonate surfactants including linear esters of  $C_8$ - $C_{20}$  carboxylic acids (i.e., fatty acids) which are sulfonated with gaseous  $SO_3$ , according to "The Journal of the American Oil Chemists Society", 52 (1975), pp. 323-329. Suitable starting materials would include natural fatty substances as derived from tallow, palm oil, etc.

The preferred alkyl ester sulfonate surfactant, especially for laundry applications, comprise alkyl ester sulfonate surfactants of the structural formula:

wherein  $R^3$  is a  $C_8$ - $C_{20}$  hydrocarbyl, preferably an alkyl, or combination thereof,  $R^4$  is a  $C_1$ - $C_6$  hydrocarbyl, preferably an alkyl, or combination thereof, and M is a cation which forms a water soluble salt with the alkyl ester sulfonate. Suitable salt-forming cations include metals such as sodium, potassium, and lithium, and substituted or unsubstituted ammonium cations, such as monoethanolamine, diethanolamine, and triethanolamine. Preferably,  $R^3$  is  $C_{10}$ - $C_{16}$  alkyl, and  $R^4$  is methyl, ethyl or isopropyl. Especially preferred are the methyl ester sulfonates wherein  $R^3$  is  $C_{10}$ - $C_{16}$  alkyl.

Other suitable anionic surfactants include the alkyl sulfate surfactants which are water soluble salts or acids of the formula  $ROSO_3M$  wherein R preferably is a  $C_{10}$ - $C_{24}$  hydrocarbyl, preferably an alkyl or hydroxyalkyl having a  $C_{10}$ - $C_{20}$  alkyl component, more preferably a  $C_{12}$ - $C_{18}$  alkyl or hydroxyalkyl, and M is H or a cation, e.g., an alkali metal cation (e.g. sodium, potassium, lithium), or ammonium or substituted ammonium (e.g. methyl-, dimethyl-, and trimethyl ammonium cations and quaternary ammonium cations such as tetramethyl-ammonium and dimethyl piperdinium cations and quaternary ammonium cations derived from alkylamines such as ethylamine, diethylamine, triethylamine, and mixtures thereof, and the like). Typically, alkyl chains of  $C_{12}$ - $C_{16}$  are preferred for lower wash temperatures (e.g. below about  $50^\circ\text{C}$ ) and  $C_{16}$ - $C_{18}$  alkyl chains are preferred for higher wash temperatures (e.g. above about  $50^\circ\text{C}$ ).

Other anionic surfactants useful for deterative purposes can also be included in the laundry detergent compositions of the present invention. These can include salts (including, for example, sodium, potassium, ammonium, and substituted ammonium salts such as mono- di- and triethanolamine salts) of soap,  $C_8$ - $C_{22}$  primary or secondary alkanesulfonates,  $C_8$ - $C_{24}$

olefinsulfonates, sulfonated polycarboxylic acids prepared by sulfonation of the pyrolyzed product of alkaline earth metal citrates, e.g., as described in British patent specification No. 1,082,179, C<sub>8</sub>-C<sub>24</sub> alkylpolyglycolethersulfates (containing up to 10 moles of ethylene oxide); alkyl glycerol sulfonates, fatty acyl glycerol sulfonates, fatty oleyl glycerol sulfates, alkyl phenol ethylene oxide ether sulfates, paraffin sulfonates, alkyl phosphates, isethionates such as the acyl isethionates, N-acyl taurates, alkyl succinamates and sulfosuccinates, monoesters of sulfosuccinates (especially saturated and unsaturated C<sub>12</sub>-C<sub>18</sub> monoesters) and diesters of sulfosuccinates (especially saturated and unsaturated C<sub>6</sub>-C<sub>12</sub> diesters), acyl sarcosinates, sulfates of alkylpolysaccharides such as the sulfates of alkylpolyglucoside (the nonionic nonsulfated compounds being described below), branched primary alkyl sulfates, and alkyl polyethoxy carboxylates such as those of the formula  $RO(CH_2CH_2O)_k-CH_2COO-M^+$  wherein R is a C<sub>8</sub>-C<sub>22</sub> alkyl, k is an integer from 1 to 10, and M is a soluble salt forming cation. Resin acids and hydrogenated resin acids are also suitable, such as rosin, hydrogenated rosin, and resin acids and hydrogenated resin acids present in or derived from tall oil.

Alkylbenzene sulfonates are highly preferred. Especially preferred are linear (straight-chain) alkyl benzene sulfonates (LAS) wherein the alkyl group preferably contains from 10 to 18 carbon atoms.

Further examples are described in "Surface Active Agents and Detergents" (Vol. I and II by Schwartz, Perry and Berch). A variety of such surfactants are also generally disclosed in US 3,929,678, (Column 23, line 58 through Column 29, line 23, herein incorporated by reference).

When included therein, the laundry detergent compositions of

the present invention typically comprise from about 1% to about 40%, preferably from about 3% to about 20% by weight of such anionic surfactants.

5 The laundry detergent compositions of the present invention may also contain cationic, ampholytic, zwitterionic, and semi-polar surfactants, as well as the nonionic and/or anionic surfactants other than those already described herein.

10

Cationic deterative surfactants suitable for use in the laundry detergent compositions of the present invention are those having one long-chain hydrocarbonyl group. Examples of such cationic surfactants include the ammonium surfactants  
 15 such as alkyltrimethylammonium halogenides, and those surfactants having the formula:

20 wherein  $R^2$  is an alkyl or alkyl benzyl group having from about 8 to about 18 carbon atoms in the alkyl chain, each  $R^3$  is selected from the group consisting of  $-CH_2CH_2-$ ,  $-CH_2CH(CH_3)-$ ,  $-CH_2CH(CH_2OH)-$ ,  $-CH_2CH_2CH_2-$ , and mixtures thereof; each  $R^4$  is selected from the group consisting of  $C_1-C_4$  alkyl,  $C_1-C_4$   
 25 hydroxyalkyl, benzyl ring structures formed by joining the two  $R^4$  groups,  $-CH_2CHOHCHOHCO R^6CHOHCH_2OH$ , wherein  $R^6$  is any hexose or hexose polymer having a molecular weight less than about 1000, and hydrogen when  $y$  is not 0;  $R^5$  is the same as  $R^2$  or is an alkyl chain, wherein the total number of carbon atoms  
 30 or  $R^2$  plus  $R^5$  is not more than about 18; each  $y$  is from 0 to about 10, and the sum of the  $y$  values is from 0 to about 15; and  $X$  is any compatible anion.

Highly preferred cationic surfactants are the water soluble  
 35 quaternary ammonium compounds useful in the present

composition having the formula:

- 5 wherein  $R_1$  is  $C_8-C_{16}$  alkyl, each of  $R_2$ ,  $R_3$  and  $R_4$  is independently  $C_1-C_4$  alkyl,  $C_1-C_4$  hydroxy alkyl, benzyl, and  $(C_2H_4O)_xH$  where  $x$  has a value from 2 to 5, and  $X$  is an anion. Not more than one of  $R_2$ ,  $R_3$  or  $R_4$  should be benzyl.
- 10 The preferred alkyl chain length for  $R_1$  is  $C_{12}-C_{15}$ , particularly where the alkyl group is a mixture of chain lengths derived from coconut or palm kernel fat or is derived synthetically by olefin build up or OXO alcohols synthesis.
- 15 Preferred groups for  $R_2$ ,  $R_3$  and  $R_4$  are methyl and hydroxyethyl groups and the anion  $X$  may be selected from halide, methosulphate, acetate and phosphate ions.

Examples of suitable quaternary ammonium compounds of

- 20 formulae (i) for use herein are:
- coconut trimethyl ammonium chloride or bromide;
  - coconut methyl dihydroxyethyl ammonium chloride or bromide;
  - decyl triethyl ammonium chloride;
  - decyl dimethyl hydroxyethyl ammonium chloride or bromide;
  - 25  $C_{12-15}$  dimethyl hydroxyethyl ammonium chloride or bromide;
  - coconut dimethyl hydroxyethyl ammonium chloride or bromide;
  - myristyl trimethyl ammonium methyl sulphate;
  - lauryl dimethyl benzyl ammonium chloride or bromide;
  - lauryl dimethyl (ethenoxy)<sub>4</sub> ammonium chloride or bromide;
  - 30 choline esters (compounds of formula (i) wherein  $R_1$  is

di-alkyl imidazolines [compounds of formula (i)].

Other cationic surfactants useful herein are also described  
5 in US 4,228,044 and in EP 000 224.

When included therein, the laundry detergent compositions of  
the present invention typically comprise from 0.2% to about  
25%, preferably from about 1% to about 8% by weight of such  
10 cationic surfactants.

Ampholytic surfactants are also suitable for use in the  
laundry detergent compositions of the present invention.  
These surfactants can be broadly described as aliphatic  
15 derivatives of secondary or tertiary amines, or aliphatic  
derivatives of heterocyclic secondary and tertiary amines in  
which the aliphatic radical can be straight- or branched-  
chain. One of the aliphatic substituents contains at least  
about 8 carbon atoms, typically from about 8 to about 18  
20 carbon atoms, and at least one contains an anionic water-  
solubilizing group, e.g. carboxy, sulfonate, sulfate. See US  
3,929,678 (column 19, lines 18-35) for examples of ampholytic  
surfactants.

25 When included therein, the laundry detergent compositions of  
the present invention typically comprise from 0.2% to about  
15%, preferably from about 1% to about 10% by weight of such  
ampholytic surfactants.

30 Zwitterionic surfactants are also suitable for use in laundry  
detergent compositions. These surfactants can be broadly  
described as derivatives of secondary and tertiary amines,  
derivatives of heterocyclic secondary and tertiary amines, or  
derivatives of quaternary ammonium, quaternary phosphonium or  
35 tertiary sulfonium compounds. See US 3,929,678 (column 19,

line 38 through column 22, line 48) for examples of zwitterionic surfactants.

When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 15%, preferably from about 1% to about 10% by weight of such zwitterionic surfactants.

Semi-polar nonionic surfactants are a special category of nonionic surfactants which include water-soluble amine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; watersoluble phosphine oxides containing one alkyl moiety of from about 10 to about 18 carbon atoms and 2 moieties selected from the group consisting of alkyl groups and hydroxyalkyl groups containing from about 1 to about 3 carbon atoms; and water-soluble sulfoxides containing one alkyl moiety from about 10 to about 18 carbon atoms and a moiety selected from the group consisting of alkyl and hydroxyalkyl moieties of from about 1 to about 3 carbon atoms.

Semi-polar nonionic detergent surfactants include the amine oxide surfactants having the formula:

wherein  $\text{R}^3$  is an alkyl, hydroxyalkyl, or alkyl phenyl group or mixtures thereof containing from about 8 to about 22 carbon atoms;  $\text{R}^4$  is an alkylene or hydroxyalkylene group containing from about 2 to about 3 carbon atoms or mixtures thereof;  $x$  is from 0 to about 3; and each  $\text{R}^5$  is an alkyl or

hydroxyalkyl group containing from about 1 to about 3 carbon atoms or a polyethylene oxide group containing from about 1 to about 3 ethylene oxide groups. The R<sup>5</sup> groups can be attached to each other, e.g., through an oxygen or nitrogen atom, to form a ring structure.

These amine oxide surfactants in particular include C<sub>10</sub>-C<sub>18</sub> alkyl dimethyl amine oxides and C<sub>8</sub>-C<sub>12</sub> alkoxy ethyl dihydroxy ethyl amine oxides.

10

When included therein, the laundry detergent compositions of the present invention typically comprise from 0.2% to about 15%, preferably from about 1% to about 10% by weight of such semi-polar nonionic surfactants.

15

#### Builder system

The compositions according to the present invention may further comprise a builder system. Any conventional builder system is suitable for use herein including aluminosilicate materials, silicates, polycarboxylates and fatty acids, materials such as ethylenediamine tetraacetate, metal ion sequestrants such as aminopolyphosphonates, particularly ethylenediamine tetramethylene phosphonic acid and diethylene triamine pentamethylenephosphonic acid. Though less preferred for obvious environmental reasons, phosphate builders can also be used herein.

Suitable builders can be an inorganic ion exchange material, commonly an inorganic hydrated aluminosilicate material, more particularly a hydrated synthetic zeolite such as hydrated zeolite A, X, B, HS or MAP.

Another suitable inorganic builder material is layered silicate, e.g. SKS-6 (Hoechst). SKS-6 is a crystalline layered silicate consisting of sodium silicate (Na<sub>2</sub>Si<sub>2</sub>O<sub>5</sub>).

35

Suitable polycarboxylates containing one carboxy group include lactic acid, glycolic acid and ether derivatives thereof as disclosed in Belgian Patent Nos. 831,368, 821,369 and 821,370. Polycarboxylates containing two carboxy groups include the water-soluble salts of succinic acid, malonic acid, (ethylenedioxy) diacetic acid, maleic acid, diglycollic acid, tartaric acid, tartronic acid and fumaric acid, as well as the ether carboxylates described in German Offenle-  
enschrift 2,446,686, and 2,446,487, US 3,935,257 and the sulfinyl carboxylates described in Belgian Patent No. 840,623. Polycarboxylates containing three carboxy groups include, in particular, water-soluble citrates, aconitrates and citraconates as well as succinate derivatives such as the carboxymethyloxysuccinates described in British Patent No. 1,379,241, lactoxysuccinates described in Netherlands Application 7205873, and the oxypolycarboxylate materials such as 2-oxa-1,1,3-propane tricarboxylates described in British Patent No. 1,387,447.

Polycarboxylates containing four carboxy groups include oxydisuccinates disclosed in British Patent No. 1,261,829, 1,1,2,2,-ethane tetracarboxylates, 1,1,3,3-propane tetracarboxylates containing sulfo substituents include the sulfosuccinate derivatives disclosed in British Patent Nos. 1,398,421 and 1,398,422 and in US 3,936,448, and the sulfonated pyrolysed citrates described in British Patent No. 1,082,179, while polycarboxylates containing phosphone substituents are disclosed in British Patent No. 1,439,000.

Alicyclic and heterocyclic polycarboxylates include cyclopentane-cis,cis-cis-tetracarboxylates, cyclopentadienide pentacarboxylates, 2,3,4,5-tetrahydro-furan - cis, cis, cis-tetracarboxylates, 2,5-tetrahydro-furan-cis, discarboxylates, 2,2,5,5,-tetrahydrofuran - tetracarboxylates, 1,2,3,4,5,6-

hexane - hexacarboxylates and carboxymethyl derivatives of polyhydric alcohols such as sorbitol, mannitol and xylitol. Aromatic polycarboxylates include mellitic acid, pyromellitic acid and the phthalic acid derivatives disclosed in British  
5 Patent No. 1,425,343.

Of the above, the preferred polycarboxylates are hydroxycarboxylates containing up to three carboxy groups per molecule, more particularly citrates.

10

Preferred builder systems for use in the present compositions include a mixture of a water-insoluble aluminosilicate builder such as zeolite A or of a layered silicate (SKS-6), and a water-soluble carboxylate chelating agent such as  
15 citric acid.

20

A suitable chelant for inclusion in the detergent compositions in accordance with the invention is ethylenediamine-N,N'-disuccinic acid (EDDS) or the alkali metal, alkaline earth metal, ammonium, or substituted ammonium salts thereof, or mixtures thereof. Preferred EDDS compounds are the free acid form and the sodium or magnesium salt thereof. Examples of such preferred sodium salts of EDDS include  $\text{Na}_2\text{EDDS}$  and  $\text{Na}_4\text{EDDS}$ . Examples of such preferred magnesium salts of EDDS  
25 include  $\text{MgEDDS}$  and  $\text{Mg}_2\text{EDDS}$ . The magnesium salts are the most preferred for inclusion in compositions in accordance with the invention.

30

Preferred builder systems include a mixture of a water-insoluble aluminosilicate builder such as zeolite A, and a water soluble carboxylate chelating agent such as citric acid.

35

Other builder materials that can form part of the builder system for use in granular compositions include inorganic

materials such as alkali metal carbonates, bicarbonates, silicates, and organic materials such as the organic phosphonates, amino polyalkylene phosphonates and amino polycarboxylates.

5

Other suitable water-soluble organic salts are the homo- or co-polymeric acids or their salts, in which the polycarboxylic acid comprises at least two carboxyl radicals separated from each other by not more than two carbon atoms.

10

Polymers of this type are disclosed in GB-A-1,596,756. Examples of such salts are polyacrylates of MW 2000-5000 and their copolymers with maleic anhydride, such copolymers having a molecular weight of from 20,000 to 70,000, especially about 40,000.

15

Detergency builder salts are normally included in amounts of from 5% to 80% by weight of the composition. Preferred levels of builder for liquid detergents are from 5% to 30%.

20

#### Enzymes

In addition to the enzyme hybrid(s) in question, detergent compositions of the invention may comprise other enzymes which provide cleaning performance and/or fabric care benefits. Such enzymes include proteases, lipases, cutinases, amylases, cellulases, peroxidases and oxidases (e.g. laccases).

25

Proteases: Any protease suitable for use in alkaline solutions may, for example, be used. Suitable proteases include those of animal, vegetable or microbial origin. Microbial origin is preferred. Chemically or genetically modified mutants are included. The protease may be a serine protease, preferably an alkaline microbial protease or a trypsin-like protease. Examples of alkaline proteases are subtilisins,

30  
35

especially those derived from Bacillus, e.g., subtilisin Novo, subtilisin Carlsberg, subtilisin 309, subtilisin 147 and subtilisin 168 (described in WO 89/06279). Examples of trypsin-like proteases are trypsin (e.g. of porcine or bovine origin) and the Fusarium protease described in WO 89/06270.

Preferred commercially available protease enzymes include those sold under the trade names Alcalase, Savinase, Primase, Durazym, and Esperase by Novo Nordisk A/S (Denmark), those sold under the tradename Maxatase, Maxacal, Maxapem, Properase, Purafect and Purafect OXP by Genencor International, and those sold under the tradename Opticlean and Optimase by Solvay Enzymes. Protease enzymes may be incorporated into the compositions in accordance with the invention at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, suitably at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, such as at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, appropriately at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Lipases: Any lipase suitable for use in alkaline solutions may, for example, be used. Suitable lipases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included.

Examples of useful lipases include a Humicola lanuginosa lipase, e.g., as described in EP 258 068 and EP 305 216, a Rhizomucor miehei lipase, e.g., as described in EP 238 023, a Candida lipase, such as a C. antarctica lipase, e.g., the C. antarctica lipase A or B described in EP 214 761, a Pseudomonas lipase such as a P. alcaligenes and P. pseudoalcaligenes lipase, e.g. as described in EP 218 272, a P. cepacia lipase, e.g., as described in EP 331 376, a P.

stutzeri lipase, e.g., as disclosed in GB 1,372,034, a P. fluorescens lipase, a Bacillus lipase, e.g., a B. subtilis lipase (Dartois et al., (1993), Biochemica et Biophysica acta 1131, 253-260), a B. stearothermophilus lipase (JP 64/744992) and a B. pumilus lipase (WO 91/16422).

Furthermore, a number of cloned lipases may be useful, including the Penicillium camembertii lipase described by Yamaguchi et al., (1991), Gene 103, 61-67), the Geotricum candidum lipase (Schimada, Y. et al., (1989), J. Biochem., 106, 383-388), and various Rhizopus lipases such as a R. delemar lipase (Hass, M.J et al., (1991), Gene 109, 117-113), a R. niveus lipase (Kugimiya et al., (1992), Biosci. Biotech. Biochem. 56, 716-719) and a R. oryzae lipase.

Other types of lipolytic enzymes such as cutinases may also be useful, e.g., a cutinase derived from Pseudomonas mendocina as described in WO 88/09367, or a cutinase derived from Fusarium solani pisi (e.g. described in WO 90/09446).

Especially suitable lipases are lipases such as M1 Lipase™, Luma fast™ and Lipomax™ (Genencor), Lipolase™ and Lipolase Ultra™ (Novo Nordisk A/S), and Lipase P "Amano" (Amano Pharmaceutical Co. Ltd.).

The lipases are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, such as at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, e.g. at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, appropriately at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Amylases: Any amylase (e.g.  $\alpha$ - and/or  $\beta$ -) suitable for use in

alkaline solutions may, for example, be used. Suitable amylases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included. Amylases include, for example,  $\alpha$ -amylases obtained from a special strain of B. licheniformis, described in more detail in GB 1,296,839. Commercially available amylases are Duramyl™, Termamyl™, Fungamyl™ and BAN™ (available from Novo Nordisk A/S) and Rapidase™ and Maxamyl P™ (available from Genencor).

The amylases are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, such as at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, e.g. at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, appropriately at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Cellulases: Any cellulase suitable for use in alkaline solutions may, for example, be used. Suitable cellulases include those of bacterial or fungal origin. Chemically or genetically modified mutants are included. Suitable cellulases are disclosed in US 4,435,307, which discloses fungal cellulases produced from Humicola insolens. Especially suitable cellulases are the cellulases having colour care benefits. Examples of such cellulases are cellulases described in European patent application No. 0 495 257.

Commercially available cellulases include Celluzyme™ produced by a strain of Humicola insolens, (Novo Nordisk A/S), and KAC-500(B)™ (Kao Corporation).

Cellulases are normally incorporated in the detergent

composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, such as at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, e.g. at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, appropriately at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Peroxidases/oxidases: Peroxidase enzymes are normally used in combination with hydrogen peroxide or a source thereof (e.g. a percarbonate, perborate or persulfate). Oxidase enzymes are used in combination with oxygen. Both types of enzymes are used for "solution bleaching", i.e. to prevent transfer of a textile dye from a dyed fabric to another fabric when said fabrics are washed together in a wash liquor, preferably together with an enhancing agent as described in e.g. WO 94/12621 and WO 95/01426. Suitable peroxidases/oxidases include those of plant, bacterial or fungal origin. Chemically or genetically modified mutants are included.

Peroxidase and/or oxidase enzymes are normally incorporated in the detergent composition at a level of from 0.00001% to 2% of enzyme protein by weight of the composition, such as at a level of from 0.0001% to 1% of enzyme protein by weight of the composition, e.g. at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, appropriately at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Mixtures of the above-mentioned enzymes may also be included in detergent compositions of the invention, e.g. a mixture of a protease, an amylase, a lipase and/or a cellulase.

The enzyme hybrid, or any other enzyme incorporated in the detergent composition, is normally incorporated in the

detergent composition at a level from 0.00001% to 2% of enzyme protein by weight of the composition, preferably at a level from 0.0001% to 1% of enzyme protein by weight of the composition, such as at a level of from 0.001% to 0.5% of enzyme protein by weight of the composition, e.g. at a level of from 0.01% to 0.2% of enzyme protein by weight of the composition.

Bleaching agents: Additional optional detergent ingredients that can be included in the detergent compositions of the present invention include bleaching agents such as PB1, PB4 and percarbonate with a particle size of 400-800 microns. These bleaching agent components can include one or more oxygen bleaching agents and, depending upon the bleaching agent chosen, one or more bleach activators. When present oxygen bleaching compounds will typically be present at levels of from about 1% to about 25%. In general, bleaching compounds are optional added components in non-liquid formulations, e.g. granular detergents.

A bleaching agent component for use herein can be any of the bleaching agents useful for detergent compositions including oxygen bleaches, as well as others known in the art.

A bleaching agent suitable for the present invention can be an activated or non-activated bleaching agent.

One category of oxygen bleaching agent that can be used encompasses percarboxylic acid bleaching agents and salts thereof. Suitable examples of this class of agents include magnesium monoperoxyphthalate hexahydrate, the magnesium salt of meta-chloro perbenzoic acid, 4-nonylamino-4-oxoperoxybutyric acid and diperoxydodecanedioic acid. Such bleaching agents are disclosed in US 4,483,781, US 740,446, EP 0 133 354 and US 4,412,934. Highly preferred bleaching

agents also include 6-nonylamino-6-oxoperoxycaproic acid as described in US 4,634,551.

Another category of bleaching agents that can be used  
5 encompasses the halogen bleaching agents. Examples of  
hypohalite bleaching agents, for example, include trichloro  
isocyanuric acid and the sodium and potassium  
dichloroisocyanurates and N-chloro and N-bromo alkane  
sulphonamides. Such materials are normally added at 0.5-10%  
10 by weight of the finished product, preferably 1-5% by weight.

The hydrogen peroxide releasing agents can be used in  
combination with bleach activators such as tetra-  
acetylenediamine (TAED), nonanoyloxybenzenesulfonate  
15 (NOBS, described in US 4,412,934), 3,5-trimethyl-  
hexanoyloxybenzenesulfonate (ISONOBS, described in EP 120  
591) or pentaacetylglucose (PAG), which are perhydrolyzed to  
form a peracid as the active bleaching species, leading to  
improved bleaching effect. In addition, very suitable are the  
20 bleach activators C8(6-octanamido-caproyl) oxybenzene-  
sulfonate, C9(6-nonanamido caproyl) oxybenzenesulfonate and  
C10 (6-decanamido caproyl) oxybenzenesulfonate or mixtures  
thereof. Also suitable activators are acylated citrate esters  
such as disclosed in European Patent Application No.  
25 91870207.7.

Useful bleaching agents, including peroxyacids and bleaching  
systems comprising bleach activators and peroxygen bleaching  
compounds for use in cleaning compositions according to the  
30 invention are described in application USSN 08/136,626.

The hydrogen peroxide may also be present by adding an  
enzymatic system (i.e. an enzyme and a substrate therefore)  
which is capable of generation of hydrogen peroxide at the  
35 beginning or during the washing and/or rinsing process. Such

enzymatic systems are disclosed in European Patent Application EP 0 537 381.

5 Bleaching agents other than oxygen bleaching agents are also known in the art and can be utilized herein. One type of non-oxygen bleaching agent of particular interest includes photoactivated bleaching agents such as the sulfonated zinc and/or aluminium phthalocyanines. These materials can be deposited upon the substrate during the washing process. Upon  
10 irradiation with light, in the presence of oxygen, such as by hanging clothes out to dry in the daylight, the sulfonated zinc phthalocyanine is activated and, consequently, the substrate is bleached. Preferred zinc phthalocyanine and a photoactivated bleaching process are described in US  
15 4,033,718. Typically, detergent composition will contain about 0.025% to about 1.25%, by weight, of sulfonated zinc phthalocyanine.

Bleaching agents may also comprise a manganese catalyst. The  
20 manganese catalyst may, e.g., be one of the compounds described in "Efficient manganese catalysts for low-temperature bleaching", Nature 369, 1994, pp. 637-639.

Suds suppressors: Another optional ingredient is a suds  
25 suppressor, exemplified by silicones, and silica-silicone mixtures. Silicones can generally be represented by alkylated polysiloxane materials, while silica is normally used in finely divided forms exemplified by silica aerogels and xerogels and hydrophobic silicas of various types. These  
30 materials can be incorporated as particulates, in which the suds suppressor is advantageously releasably incorporated in a water-soluble or water-dispersible, substantially non surface-active detergent impermeable carrier. Alternatively the suds suppressor can be dissolved or dispersed in a liquid  
35 carrier and applied by spraying on to one or more of the

other components.

A preferred silicone suds controlling agent is disclosed in US 3,933,672. Other particularly useful suds suppressors are the self-emulsifying silicone suds suppressors, described in German Patent Application DTOS 2,646,126. An example of such a compound is DC-544, commercially available from Dow Corning, which is a siloxane-glycol copolymer. Especially preferred suds controlling agent are the suds suppressor system comprising a mixture of silicone oils and 2-alkyl-alkanols. Suitable 2-alkyl-alkanols are 2-butyl-octanol which are commercially available under the trade name Isofol 12 R.

Such suds suppressor system are described in European Patent Application EP 0 593 841.

Especially preferred silicone suds controlling agents are described in European Patent Application No. 92201649.8. Said compositions can comprise a silicone/ silica mixture in combination with fumed nonporous silica such as Aerosil<sup>R</sup>.

The suds suppressors described above are normally employed at levels of from 0.001% to 2% by weight of the composition, preferably from 0.01% to 1% by weight.

Other components: Other components used in detergent compositions may be employed, such as soil-suspending agents, soil-releasing agents, optical brighteners, abrasives, bactericides, tarnish inhibitors, coloring agents, and/or encapsulated or nonencapsulated perfumes.

Especially suitable encapsulating materials are water soluble capsules which consist of a matrix of polysaccharide and polyhydroxy compounds such as described in GB 1,464,616.

Other suitable water soluble encapsulating materials comprise dextrins derived from ungelatinized starch acid esters of substituted dicarboxylic acids such as described in US 3,455,838. These acid-ester dextrins are, preferably, prepared from such starches as waxy maize, waxy sorghum, sago, tapioca and potato. Suitable examples of said encapsulation materials include N-Lok manufactured by National Starch. The N-Lok encapsulating material consists of a modified maize starch and glucose. The starch is modified by adding monofunctional substituted groups such as octenyl succinic acid anhydride.

Antiredeposition and soil suspension agents suitable herein include cellulose derivatives such as methylcellulose, carboxymethylcellulose and hydroxyethylcellulose, and homo- or co-polymeric polycarboxylic acids or their salts. Polymers of this type include the polyacrylates and maleic anhydride-acrylic acid copolymers previously mentioned as builders, as well as copolymers of maleic anhydride with ethylene, methylvinyl ether or methacrylic acid, the maleic anhydride constituting at least 20 mole percent of the copolymer. These materials are normally used at levels of from 0.5% to 10% by weight, more preferably from 0.75% to 8%, most preferably from 1% to 6% by weight of the composition.

Preferred optical brighteners are anionic in character, examples of which are disodium 4,4'-bis-(2-diethanolamino-4-anilino -s- triazin-6-ylamino)stilbene-2:2' disulphonate, disodium 4, - 4'-bis-(2-morpholino-4-anilino-s-triazin-6-ylamino-stilbene-2:2' - disulphonate, disodium 4,4' - bis-(2,4-dianilino-s-triazin-6-ylamino)stilbene-2:2' - disulphonate, monosodium 4',4'' - bis-(2,4-dianilino-s-triazin-6 ylamino)stilbene-2-sulphonate, disodium 4,4' -bis-(2-anilino-4-(N-methyl-N-2-hydroxyethylamino)-s-triazin-6-ylamino)stilbene-2,2' - disulphonate, di-sodium 4,4' -bis-(4-

phenyl-2,1,3-triazol-2-yl)-stilbene-2,2' disulphonate, di-sodium 4,4'-bis(2-anilino-4-(1-methyl-2-hydroxyethylamino)-s-triazin-6-ylamino)stilbene-2,2'disulphonate, sodium 2(stilbyl-4''-(naphtho-1',2':4,5)-1,2,3, - triazole-2''-sulphonate and 4,4'-bis(2-sulphostyryl)biphenyl.

Other useful polymeric materials are the polyethylene glycols, particularly those of molecular weight 1000-10000, more particularly 2000 to 8000 and most preferably about 4000. These are used at levels of from 0.20% to 5% more preferably from 0.25% to 2.5% by weight. These polymers and the previously mentioned homo- or co-polymeric polycarboxylate salts are valuable for improving whiteness maintenance, fabric ash deposition, and cleaning performance on clay, proteinaceous and oxidizable soils in the presence of transition metal impurities.

Soil release agents useful in compositions of the present invention are conventionally copolymers or terpolymers of terephthalic acid with ethylene glycol and/or propylene glycol units in various arrangements. Examples of such polymers are disclosed in US 4,116,885 and 4,711,730 and EP 0 272 033. A particular preferred polymer in accordance with EP 0 272 033 has the formula:

where PEG is  $-(\text{OC}_2\text{H}_4)_n-$ , PO is  $(\text{OC}_3\text{H}_6\text{O})$  and T is  $(\text{pOOC}_6\text{H}_4\text{CO})$ .

Also very useful are modified polyesters as random copolymers of dimethyl terephthalate, dimethyl sulfoisophthalate, ethylene glycol and 1,2-propanediol, the end groups consisting primarily of sulphobenzoate and secondarily of mono esters of ethylene glycol and/or 1,2-propanediol. The target is to obtain a polymer capped at both end by

5 sulphobenzoate groups, "primarily", in the present context most of said copolymers herein will be endcapped by sulphobenzoate groups. However, some copolymers will be less than fully capped, and therefore their end groups may consist of monoester of ethylene glycol and/or 1,2-propanediol, thereof consist "secondarily" of such species.

10 The selected polyesters herein contain about 46% by weight of dimethyl terephthalic acid, about 16% by weight of 1,2-propanediol, about 10% by weight ethylene glycol, about 13% by weight of dimethyl sulfobenzoic acid and about 15% by weight of sulfoisophthalic acid, and have a molecular weight of about 3.000. The polyesters and their method of preparation are described in detail in EP 311 342.

15

Softening agents: Fabric softening agents can also be incorporated into laundry detergent compositions in accordance with the present invention. These agents may be inorganic or organic in type. Inorganic softening agents are exemplified by the smectite clays disclosed in GB-A-1 400898 and in US 5,019,292. Organic fabric softening agents include the water insoluble tertiary amines as disclosed in GB-A1 514 276 and EP 0 011 340 and their combination with mono  $C_{12}$ - $C_{14}$  quaternary ammonium salts are disclosed in EP-B-0 026 528 and di-long-chain amides as disclosed in EP 0 242 919. Other useful organic ingredients of fabric softening systems include high molecular weight polyethylene oxide materials as disclosed in EP 0 299 575 and 0 313 146.

30 Levels of smectite clay are normally in the range from 5% to 15%, more preferably from 8% to 12% by weight, with the material being added as a dry mixed component to the remainder of the formulation. Organic fabric softening agents such as the water-insoluble tertiary amines or dilong chain  
35 amide materials are incorporated at levels of from 0.5% to 5%

by weight, normally from 1% to 3% by weight whilst the high molecular weight polyethylene oxide materials and the water soluble cationic materials are added at levels of from 0.1% to 2%, normally from 0.15% to 1.5% by weight. These materials are normally added to the spray dried portion of the composition, although in some instances it may be more convenient to add them as a dry mixed particulate, or spray them as molten liquid on to other solid components of the composition.

Polymeric dye-transfer inhibiting agents: The detergent compositions according to the present invention may also comprise from 0.001% to 10%, preferably from 0.01% to 2%, more preferably from 0.05% to 1% by weight of polymeric dye-transfer inhibiting agents. Said polymeric dye-transfer inhibiting agents are normally incorporated into detergent compositions in order to inhibit the transfer of dyes from colored fabrics onto fabrics washed therewith. These polymers have the ability of complexing or adsorbing the fugitive dyes washed out of dyed fabrics before the dyes have the opportunity to become attached to other articles in the wash.

Especially suitable polymeric dye-transfer inhibiting agents are polyamine N-oxide polymers, copolymers of N-vinylpyrrolidone and N-vinylimidazole, polyvinylpyrrolidone polymers, polyvinylloxazolidones and polyvinylimidazoles or mixtures thereof.

Addition of such polymers also enhances the performance of the enzymes according to the invention.

The detergent composition according to the invention can be in the form of a liquid, paste, gel, bar or granulate (i.e. in granular form).

Non-dusting granulates may be produced, e.g., as disclosed in US 4,106,991 and 4,661,452 (both to Novo Industri A/S) and may optionally be coated by methods known in the art.

5 Examples of waxy coating materials are poly(ethylene oxide) products (polyethyleneglycol, PEG) with mean molecular weights of 1000 to 20000; ethoxylated nonylphenols having from 16 to 50 ethylene oxide units; ethoxylated fatty  
10 alcohols in which the alcohol contains from 12 to 20 carbon atoms and in which there are 15 to 80 ethylene oxide units; fatty alcohols; fatty acids; and mono- and di- and triglycerides of fatty acids. Examples of film-forming coating materials suitable for application by fluid bed techniques are given in GB 1483591.

15 Granular compositions according to the present invention can also be in "compact form", i.e. they may have a relatively higher density than conventional granular detergents, i.e. from 550 to 950 g/l; in such case, the granular detergent compositions according to the present invention will contain  
20 a lower amount of "Inorganic filler salt", compared to conventional granular detergents; typical filler salts are alkaline earth metal salts of sulphates and chlorides, typically sodium sulphate; "Compact" detergent typically comprise not more than 10% filler salt. The liquid compositions  
25 according to the present invention can also be in "concentrated form", in such case, the liquid detergent compositions according to the present invention will contain a lower amount of water, compared to conventional liquid detergents. Typically, the water content of the concentrated  
30 liquid detergent is less than 30%, more preferably less than 20%, most preferably less than 10% by weight of the detergent compositions.

The compositions of the invention may, for example, be  
35 formulated as hand and machine laundry detergent compositions

including laundry additive compositions and compositions suitable for use in the pretreatment of stained fabrics.

The following examples are intended to exemplify compositions within the scope of the present invention, but are not intended to limit or otherwise define the scope of the invention. In the detergent compositions, the abbreviated component identifications have the following meanings:

- 10 LAS: Sodium linear  $C_{12}$  alkyl benzene sulphonate  
TAS: Sodium tallow alkyl sulphate  
XYAS: Sodium  $C_{1x} - C_{1y}$  alkyl sulfate  
15 SS: Secondary soap surfactant of formula 2-butyl octanoic acid  
20 25EY: A  $C_{12} - C_{15}$  predominantly linear primary alcohol condensed with an average of Y moles of ethylene oxide  
45EY: A  $C_{14} - C_{15}$  predominantly linear primary alcohol condensed with an average of Y moles of ethylene oxide  
25 XYEZS:  $C_{1x} - C_{1y}$  sodium alkyl sulfate condensed with an average of Z moles of ethylene oxide per mole  
Nonionic:  $C_{13} - C_{15}$  mixed ethoxylated/propoxylated fatty alcohol with an average degree of ethoxylation of 3.8 and an  
30 average degree of propoxylation of 4.5 sold under the tradename Plurafax LF404 by BASF GmbH  
CFAA:  $C_{12} - C_{14}$  alkyl N-methyl glucamide  
35 TFAA:  $C_{16} - C_{18}$  alkyl N-methyl glucamide  
Silicate: Amorphous Sodium Silicate ( $SiO_2:Na_2O$  ratio = 2.0)  
NaSKS-6: Crystalline layered silicate of formula  $\delta-Na_2Si_2O_5$   
40 Carbonate: Anhydrous sodium carbonate  
Phosphate: Sodium tripolyphosphate  
45 MA/AA: Copolymer of 1:4 maleic/acrylic acid, average molecular weight about 80,000

- Polyacrylate: Polyacrylate homopolymer with an average molecular weight of 8,000 sold under the tradename PA30 by BASF GmbH
- 5 Zeolite A: Hydrated Sodium Aluminosilicate of formula  $\text{Na}_{12}(\text{AlO}_2\text{SiO}_2)_{12} \cdot 27\text{H}_2\text{O}$  having a primary particle size in the range from 1 to 10 micrometers
- 10 Citrate: Tri-sodium citrate dihydrate
- Citric: Citric Acid
- Perborate: Anhydrous sodium perborate monohydrate bleach, empirical formula  $\text{NaBO}_2 \cdot \text{H}_2\text{O}_2$
- 15 PB4: Anhydrous sodium perborate tetrahydrate
- Percarbonate: Anhydrous sodium percarbonate bleach of empirical formula  $2\text{Na}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}_2$
- 20 TAED: Tetraacetyl ethylene diamine
- CMC: Sodium carboxymethyl cellulose
- 25 DETPMP: Diethylene triamine penta (methylene phosphonic acid), marketed by Monsanto under the Tradename Dequest 2060
- PVP: Polyvinylpyrrolidone polymer
- 30 EDDS: Ethylenediamine-N, N'-disuccinic acid, [S,S] isomer in the form of the sodium salt
- 35 Suds 25% paraffin wax Mpt 50°C, 17% hydrophobic silica, 58%
- Suppressor: paraffin oil
- 40 Granular Suds 12% Silicone/silica, 18% stearyl alcohol, 70%  
suppressor: starch in granular form
- Sulphate: Anhydrous sodium sulphate
- 45 HMWPEO: High molecular weight polyethylene oxide
- TAE 25: Tallow alcohol ethoxylate (25)
- 50 In the following compositions, "Enzyme" refers to enzyme hybrid(s) and any added enzyme(s):

Detergent Example I

A granular fabric cleaning composition in accordance with the invention may be prepared as follows:

5	Sodium linear C <sub>12</sub> alkyl benzene sulfonate	6.5
	Sodium sulfate	15.0
	Zeolite A	26.0
10	Sodium nitrilotriacetate	5.0
	Enzyme	0.1
15	PVP	0.5
	TAED	3.0
	Boric acid	4.0
20	Perborate	18.0
	Phenol sulphonate	0.1
25	Minors	Up to 100

Detergent Example II

A compact granular fabric cleaning composition (density 800 g/l) in accord with the invention may be prepared as follows:

30	45AS	8.0
	25E3S	2.0
	25E5	3.0
	25E3	3.0
35	TFAA	2.5
	Zeolite A	17.0
	NaSKS-6	12.0
	Citric acid	3.0
	Carbonate	7.0
40	MA/AA	5.0
	CMC	0.4
	Enzyme	0.1

	TAED	6.0
	Percarbonate	22.0
	EDDS	0.3
	Granular suds suppressor	3.5
5	water/minors	Up to 100%

Detergent Example III

Granular fabric cleaning compositions in accordance with the invention which are useful in the laundering of coloured fabrics may be prepared as follows:

	LAS	10.7	-
	TAS	2.4	-
	TFAA	-	4.0
	45AS	3.1	10.0
15	45E7	4.0	-
	25E3S	-	3.0
	68E11	1.8	-
	25E5	-	8.0
	Citrate	15.0	7.0
20	Carbonate	-	10
	Citric acid	2.5	3.0
	Zeolite A	32.1	25.0
	Na-SKS-6	-	9.0
	MA/AA	5.0	5.0
25	DETPMP	0.2	0.8
	Enzyme	0.10	0.05
	Silicate	2.5	-
	Sulphate	5.2	3.0
	PVP	0.5	-
30	Poly (4-vinylpyridine)-N-Oxide/copolymer of vinyl-imidazole and vinyl-pyrrolidone	-	0.2
35	Perborate	1.0	-
	Phenol sulfonate	0.2	-

Water/Minors

Up to 100%

Detergent Example IV

Granular fabric cleaning compositions in accordance with the invention which provide "Softening through the wash" capability may be prepared as follows:

	45AS	-	10.0
	LAS	7.6	-
	68AS	1.3	-
5	45E7	4.0	-
	25E3	-	5.0
	Coco-alkyl-dimethyl hydroxy-ethyl ammonium chloride	1.4	1.0
10			
	Citrate	5.0	3.0
	Na-SKS-6	-	11.0
	Zeolite A	15.0	15.0
	MA/AA	4.0	4.0
	DETPMP	0.4	0.4
15			
	Perborate	15.0	-
	Percarbonate	-	15.0
	TAED	5.0	5.0
	Smectite clay	10.0	10.0
	HMWPEO	-	0.1
20			
	Enzyme	0.10	0.05
	Silicate	3.0	5.0
	Carbonate	10.0	10.0
	Granular suds suppressor	1.0	4.0
	CMC	0.2	0.1
25			
	Water/Minors	Up to 100%	

Detergent Example V

Heavy duty liquid fabric cleaning compositions in accordance with the invention may be prepared as follows:

53

	I	II
LAS acid form	-	25.0
Citric acid	5.0	2.0
25AS acid form	8.0	-
5 25AE2S acid form	3.0	-
25AE7	8.0	-
CFAA	5	-
DETPMP	1.0	1.0
Fatty acid	8	-
10 Oleic acid	-	1.0
Ethanol	4.0	6.0
Propanediol	2.0	6.0
Enzyme	0.10	0.05
15 Coco-alkyl dimethyl hydroxy ethyl ammonium chloride	-	3.0
Smectite clay	-	5.0
PVP	2.0	-
20 Water / Minors	Up to 100%	

The enzyme hybrid may be incorporated in concentrations conventionally employed in detergents. It is at present  
 25 contemplated that, in the detergent composition of the invention, the enzyme hybrid may suitably be added in an amount corresponding to 0.00001-1 mg (calculated as pure enzymatic protein) of enzyme hybrid per liter of wash liquor.

### 30 Reaction time

The reaction time for removing or bleaching the soiling or stain(s) from fabric may vary; the fabric may be soaked for one or two days, or the washing may be performed within a shorter period, typically machine-washed for a period of 1 to  
 35 90 minutes, preferably for a period of 1 to 30 minutes.

A further aspect of the invention relates to a DNA construct disclosed herein which encodes, or which comprises a sequence which encodes, an enzyme hybrid as disclosed in the present specification.

A still further aspect of the invention relates to a polypeptide (fusion protein or enzyme hybrid) which is encoded by such a DNA construct or sequence, and/or which is disclosed in the present specification. Thus, the invention encompasses an enzyme hybrid encoded by a hybrid-encoding DNA sequence comprised within the DNA sequences of SEQ ID No. 1, SEQ ID No. 3, SEQ ID No. 5, SEQ ID No. 7, SEQ ID No. 9, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 15, SEQ ID No. 16, SEQ ID No. 17, SEQ ID No. 18 or SEQ ID No. 19, or an enzyme hybrid having an amino acid sequence comprised within the amino acid sequences of SEQ ID No. 2, SEQ ID No. 4, SEQ ID No. 6 or SEQ ID No. 8.

The invention is further illustrated in the following example, which are not intended to be in any way limiting to the scope of the invention as claimed.

## MATERIALS AND METHODS

### Strains:

*Bacillus agaradherens* NCIMB No. 40482: comprises the endoglucanase enzyme encoding DNA sequence of Example 2, below.

*Escherichia coli* SJ2 [Diderichsen et al., J. Bacteriol. 172 (1990), pp. 4315-4321].

Electrocompetent cells prepared and transformed using a Bio-Rad GenePulser™ as recommended by the manufacturer.

- 5 *Bacillus subtilis* PL2306: this strain is the *B. subtilis* DN1885 with disrupted *apr* and *npr* genes [Diderichsen et al., J. Bacteriol. **172** (1990), pp. 4315-4321] disrupted in the transcriptional unit of the known *Bacillus subtilis* cellulase gene, resulting in cellulase-negative cells. The disruption  
10 was performed essentially as described in Sonenshein et al. (Eds.), *Bacillus subtilis* and other Gram-Positive Bacteria, American Society for Microbiology (1993), p.618.

#### Plasmids:

- 15 pDN1528 [Jørgensen et al., J. Bacteriol. **173** (1991), p.559-567].

pBluescriptKSII- (Stratagene, USA).

- 20 pDN1981 [Jørgensen et al., Gene **96** (1990), p37-41].

#### Solutions/Media

- TY and LB agar [as described in Ausubel et al. (Eds.), Current Protocols in Molecular Biology, John Wiley and Sons  
25 (1995)].

- SB: 32 g Tryptone, 20 g yeast extract, 5 g sodium chloride and 5 ml 1 N sodium hydroxide are mixed in sterile water to a final volume of 1 litre. The solution is sterilised by  
30 autoclaving for 20 minutes at 121°C.

10% Avicel™: 100 g of Avicel™ (FLUKA, Switzerland) is mixed with sterile water to a final volume of 1 litre, and the resulting 10% Avicel™ is sterilised by autoclaving for 20

minutes at 121°C.

Buffer: 0.05 M potassium phosphate, pH 7.5.

## 5 General molecular biology methods

DNA manipulations and transformations were performed using standard methods of molecular biology [Sambrook et al., Molecular Cloning: A Laboratory Manual, Cold Spring Harbor lab., Cold Spring Harbor, NY (1989); Ausubel et al. (Eds.), 10 Current Protocols in Molecular Biology, John Wiley and Sons (1995); C.R. Harwood and S.M. Cutting (Eds.) Molecular Biological Methods for Bacillus, John Wiley and Sons (1990)].

Enzymes for DNA manipulations were used according to the 15 specifications of the suppliers.

### EXAMPLE 1

#### Subcloning of a partial Termamyl sequence.

20 The alfa-amylase gene encoded on pDN1528 was PCR amplified for introduction of a BamHI site in the 3'-end of the coding region. The PCR and the cloning were carried out as follows:

Approximately 10-20 ng of plasmid pDN1528 was PCR amplified 25 in HiFidelity™ PCR buffer (Boehringer Mannheim, Germany) supplemented with 200 µM of each dNTP, 2.6 units of HiFidelity™ Expand enzyme mix, and 300 pmol of each primer:

#5289

30 5'-GCT TTA CGC CCG ATT GCT GAC GCT G -3'

#26748

5'-GCG ATG AGA CGC GCG GCC GCC TAT CTT TGA ACA TAA ATT GAA

ACG GAT CCG -3'

(BamHI restriction site underlined).

5 The PCR reactions were performed using a DNA thermal cycler  
(Landgraf, Germany). One incubation at 94°C for 2 min, 60°C  
for 30 sec and 72°C for 45 sec was followed by ten cycles of  
PCR performed using a cycle profile of denaturation at 94°C  
for 30 sec, annealing at 60°C for 30 sec, and extension at  
10 72°C for 45sec and twenty cycles of denaturation at 94°C for  
30 sec, 60°C for 30 sec and 72°C for 45 sec (at this  
elongation step, 20 sec are added every cycle). 10 µl  
aliquots of amplification product were analyzed by  
electrophoresis in 1.0 % agarose gels (NuSieve™, FMC) with  
15 ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size  
marker.

40 µl aliquots of PCR product generated as described above  
were purified using QIAquick™ PCR purification kit (Qiagen,  
20 USA) according to the manufacturer's instructions. The  
purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5. 25  
µl of the purified PCR fragment was digested with BamHI and  
PstI, subjected to electrophoresis in 1.0% low gelling  
temperature agarose (SeaPlaque™ GTG, FMC) gels, and the  
25 relevant fragment was excised from the gel and purified using  
QIAquick™ Gel extraction Kit (Qiagen, USA) according to the  
manufacturer's instructions. The isolated DNA fragment was  
then ligated to BamHI-PstI digested pBluescriptII KS-, and  
the ligation mixture was used to transform *E. coli* SJ2.

30

Cells were plated on LB agar plates containing Ampicillin  
(200 µg/ml) and supplemented with X-gal (5-bromo-4-chloro-3-

indolyl- $\alpha$ -D-galactopyranoside, 50  $\mu$ g/ml), and incubated at 37°C overnight. The next day, white colonies were restreaked onto fresh LB-Ampicillin agar plates and incubated at 37°C overnight. The following day, single colonies were transferred to liquid LB medium containing Ampicillin (200  $\mu$ g/ml) and incubated overnight at 37°C with shaking at 250 rpm.

Plasmids were extracted from the liquid cultures using QIAgen Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. 5  $\mu$ l samples of the plasmids were digested with PstI and BamHI. The digestions were checked by gel electrophoresis on a 1.0% agarose gel (NuSieve™, FMC). One positive clone, containing the PstI-BamHI fragment containing part of the  $\alpha$ -amylase gene, was designated pMB335. This plasmid was then used in the construction of  $\alpha$ -amylase-CBD hybrid.

#### Isolation of genomic DNA

- Clostridium stercorarium NCIMB 11754 was grown anaerobically at 60°C in specified media as recommended by The National Collections of Industrial and Marine Bacteria Ltd. (NCIMB), Scotland. Cells were harvested by centrifugation.
- Genomic DNA was isolated as described by Pitcher et al, Lett. Appl. Microbiol. 8 (1989), pp. 151-156.

#### In vitro amplification of the CBD-dimer of Clostridium stercorarium (NCIMB 11754) XynA

- Approximately 100-200 ng of genomic DNA was PCR amplified in HiFidelity™ PCR buffer (Boehringer Mannheim, Germany) supplemented with 200  $\mu$ M of each dNTP, 2.6 units of HiFidelity™ Expand enzyme mix, and 300 pmol of each primer:

#27183

5'-GCT GCA GGA TCC GTT TCA ATT TAT GTT CAA AGA TCT GGC GGA  
CCT GGA ACG CCA AAT AAT GGA AGA GG -3'

5

#27182

5'-GCA CTA GCT AGA CGG CCG CTA CCA GTC AAC ATT AAC AGG ACC  
TGA G -3'

10 (BamHI and EagI restriction sites underlined).

The primers were designed to amplify the DNA encoding the cellulose-binding domain of the XynA-encoding gene of *Clostridium stercorarium* NCIMB 11754; the DNA sequence was  
15 extracted from the database GenBank under the accession number D13325.

The PCR reactions were performed using a DNA thermal cycler (Landgraf, Germany). One incubation at 94°C for 2 min, 60°C  
20 for 30 sec and 72°C for 45 sec was followed by ten cycles of PCR performed using a cycle profile of denaturation at 94°C for 30 sec, annealing at 60°C for 30 sec, and extension at 72°C for 45 sec and twenty cycles of denaturation at 94°C for 30 sec, 60°C for 30 sec and 72°C for 45 sec (at this  
25 elongation step, 20 sec are added every cycle). 10 µl aliquots of amplification product were analyzed by electrophoresis in 1.0 % agarose gels (NuSieve™, FMC) with ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size marker.

30

**Cloning by polymerase chain reaction (PCR):**  
**Subcloning of PCR fragments.**

40 µl aliquots of PCR product generated as described above

were purified using QIAquick™ PCR purification kit (Qiagen, USA) according to the manufacturer's instructions. The purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5. 25 µl of the purified PCR fragment was digested with BamHI and EagI, subjected to electrophoresis in 1.0% low gelling temperature agarose (SeaPlaque™ GTG, FMC) gels, and the relevant fragment was excised from the gels and purified using QIAquick™ Gel extraction Kit (Qiagen, USA) according to the manufacturer's instructions. The isolated DNA fragment was then ligated to BamHI-NotI digested pMB335 and the ligation mixture was used to transform *E.coli* SJ2.

#### Identification and characterization of positive clones

Cells were plated on LB agar plates containing Ampicillin (200 µg/ml) and incubated at 37°C overnight. The next day, colonies were restreaked onto fresh LB-Ampicillin agar plates and incubated at 37°C overnight. The following day, single colonies were transferred to liquid LB medium containing Ampicillin (200 µg/ml) and incubated overnight at 37°C with shaking at 250 rpm.

Plasmids were extracted from the liquid cultures using QIAGEN Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. 5 µl samples of the plasmids were digested with BamHI and NotII. The digestions were checked by gel electrophoresis on a 1.0% agarose gel (NuSieve™, FMC). The appearance of a DNA fragment of the same size as seen from the PCR amplification indicated a positive clone.

One positive clone, containing the fusion construct of the  $\alpha$ -amylase gene and the CBD-dimer of *Clostridium stercorarium* (NCIMB 11754) XynA, was designated MBamyX.

### Cloning of the fusion construct into a *Bacillus*-based expression vector

The pDN1528 vector contains the amyL gene of *B. licheniformis*; this gene is actively expressed in *B. subtilis*, resulting in the production of active  $\alpha$ -amylase appearing in the supernatant. For expression purposes, the DNA encoding the fusion protein as constructed above was introduced to pDN1528.

10 This was done by digesting pMBamyX and pDN1528 with SalI-NotI, purifying the fragments and ligating the 4.7 kb pDN1528 SalI-NotI fragment with the 1.0 kb pMBamyX SalI-NotI fragment. This created an inframe fusion of the hybrid construction with the Termamyl<sup>TM</sup> (*B. licheniformis*  $\alpha$ -amylase) gene. The DNA sequence of the fusion construction of pMB206, and the corresponding amino acid sequence, are shown in SEQ ID No. 1 and SEQ ID No. 2, respectively.

The ligation mixture was used to transform competent cells of *B. subtilis* PL2306. Cells were plated on LB agar plates containing chloramphenicol (6  $\mu$ g/ml), 0.4% glucose and 10mM potassium hydrogen phosphate, and incubated at 37°C overnight. The next day, colonies were restreaked onto fresh LBPG (LB plates with 0.4% glucose and 10mM potassium phosphate, pH 10) chloramphenicol agar plates and incubated at 37°C overnight. The following day, single colonies of each clone were transferred to liquid LB medium containing chloramphenicol (6  $\mu$ g/ml) and incubated overnight at 37°C with shaking at 250 rpm.

Plasmids were extracted from the liquid cultures using QIAGEN Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. However, the resuspension buffer was supplemented with 1 mg/ml of chicken egg white lysozyme

(SIGMA, USA) prior to lysing the cells at 37°C for 15 minutes. 5 µl samples of the plasmids were digested with BamHI and NotI. The digestions were checked by gel electrophoresis on a 1.5% agarose gel (NuSieve™, FMC). The appearance of a DNA fragment of the same size as seen from the PCR amplification indicated a positive clone. One positive clone was designated MB-BSamyx.

#### 10 Expression, secretion and functional analysis of the fusion protein

The clone MB-BSamyx (expressing Termamyl™ fused to *C.stercorarium* XynA dimer CBD) was incubated for 20 hours in SB medium at 37°C with shaking at 250 rpm. 1 ml of cell-free supernatant was mixed with 200 µl of 10% Avicel™. The mixture was incubated for 1 hour at 0°C and then centrifuged for 5 minutes at 5000 x g. The pellet was resuspended in 100 µl of SDS-PAGE buffer, and the suspension was boiled at 95°C for 5 minutes, centrifuged at 5000 x g for 5 minutes, and 25 µl was loaded onto a 4-20% Laemmli Tris-Glycine, SDS-PAGE NOVEX™ gel (Novex, USA). The samples were subjected to electrophoresis in an Xcell™ Mini-Cell (NOVEX, USA) as recommended by the manufacturer. All subsequent handling of gels, including staining (Coomassie), destaining and drying, were performed as described by the manufacturer.

25 The appearance of a protein band of molecular weight approx. 85 kDa indicated expression in *B.subtilis* of the Termamyl-CBD fusion amyx.

#### 30 EXAMPLE 2

Identification of a novel CBD representing a new CBD family  
The alkaline cellulase cloned in *Bacillus subtilis* as

described below was expressed by incubating the clone for 20 hours in SB medium at 37°C with shaking at 250 rpm. The expressed cellulase was shown to contain a CBD by its ability to specifically bind to Avicel™.

5

When left to incubate for a further 20 hours, the cellulase was proteolytically cleaved and two specific protein bands appeared in SDS-PAGE, one corresponding to the catalytic part of the cellulase, approximate molecular weight (MW) 35 kD, and the other corresponding to a proposed linker and CBD of approximate MW 8 kD.

The CBD was found to be the C-terminal part of the cellulase, and did not match any of the CBD families described previously [Tomme et al., Cellulose-Binding Domains: Classification and Properties, In: J.N. Saddler and M.H. Penner (Eds.), Enzymatic Degradation of Insoluble Carbohydrates, ACS Symposium Series No. 618 (1996)]. Accordingly, this CBD appears to be the first member of a new family.

20

**Cloning of the alkaline cellulase (endoglucanase) from *Bacillus agaradherens* and expression of the alkaline cellulase in *Bacillus subtilis***

The nucleotide sequence encoding the alkaline cellulase from *Bacillus agaradherens* (deposited under accession No. NCIMB 40482) was cloned by PCR for introduction in an expression plasmid pDN1981. PCR was performed essentially as described above on 500 ng of genomic DNA, using the following two primers containing NdeI and KpnI restriction sites for introducing the endoglucanase-encoding DNA sequence to pDN1981 for expression:

30

#20887

5' -GTA GGC TCA GTC ATA TGT TAC ACA TTG AAA GGG GAG GAG AAT  
CAT GAA AAA GAT AAC TAC TAT TTT TGT CG-3'

#21318

5 5' -GTA CCT CGC GGG TAC CAA GCG GCC GCT TAA TTG AGT GGT TCC  
CAC GGA CCG-3'

After PCR cycling, the PCR fragment was purified using QIA-  
quick™ PCR column kit (Qiagen, USA) according to the  
10 manufacturer's instructions. The purified DNA was eluted in 50  
µl of 10mM Tris-HCl, pH 8.5, digested with NdeI and KpnI,  
purified and ligated to digested pDN1981. The ligation mixture  
was used to transform *B. subtilis* PL2306. Competent cells were  
prepared and transformed as described by Yasbin et al., J.  
15 Bacteriol. 121 (1975), pp. 296-304.

#### Isolation and testing of *B. subtilis* transformants

The transformed cells were plated on LB agar plates containing  
Kanamycin (10 mg/ml), 0.4% glucose, 10 mM potassium phosphate  
20 and 0.1% AZCL HE-cellulose (Megazyme, Australia), and  
incubated at  
37 °C for 18 hours. Endoglucanase-positive colonies were  
identified as colonies surrounded by a blue halo.

25 Each of the positive transformants was inoculated in 10 ml TY  
medium containing Kanamycin (10 mg/ml). After 1 day of incuba-  
tion at 37°C with shaking at 250rpm, 50 ml of supernatant was  
removed. The endoglucanase activity was identified by adding  
50 ml of supernatant to holes punctured in the agar of LB agar  
30 plates containing 0.1% AZCL HE-cellulose.

After 16 hours incubation at 37°C, blue halos surrounding  
holes indicated expression of the endoglucanase in *B.*  
*subtilis*. One such clone was designated MB208. The encoding

DNA sequence and amino acid sequence of the endoglucanase are shown in SEQ ID No. 3 and SEQ ID No. 4, respectively.

The DNA sequence was determined as follows: Qiagen purified  
5 plasmid DNA was sequenced with the Taq deoxy terminal cycle  
sequencing kit (Perkin Elmer, USA) using the primers #21318  
and #20887 (*vide supra*) and employing an Applied Biosystems  
373A automated sequencer operated according to the manufac-  
turer's instructions. Analysis of the sequence data is  
10 performed according to Devereux et al., Carcinogenesis 14  
(1993), pp. 795-801.

***In vitro* amplification of the CBD of *Bacillus agaradherens*  
NCIMB 40482 endoglucanase**

15 Approximately 10-20 ng of plasmid pMB208 was PCR amplified in  
HiFidelity™ PCR buffer (Boehringer Mannheim, Germany)  
supplemented with 200 µM of each dNTP, 2.6 units of  
HiFidelity™ Expand enzyme mix and 300 pmol of each primer:

(BamHI and NotI restriction sites underlined).

30

The primers were designed to amplify the CBD-encoding DNA of  
the cellulase-encoding gene of *Bacillus agaradherens* NCIMB  
40482.

The PCR reaction was performed using a DNA thermal cycler (Landgraf, Germany). One incubation at 94°C for 2 min, 60°C for 30 sec and 72°C for 45 sec was followed by ten cycles of PCR performed using a cycle profile of denaturation at 94°C for 30 sec, annealing at 60°C for 30 sec, and extension at 72°C for 45 sec and twenty cycles of denaturation at 94°C for 30 sec, 60°C for 30 sec and 72°C for 45 sec (at this elongation step, 20 sec are added every cycle). 10 µl aliquots of amplification product were analyzed by electrophoresis in 1.5 % agarose gels (NuSieve™, FMC) with ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size marker.

#### **Cloning by polymerase chain reaction (PCR):**

##### **15 Subcloning of PCR fragments**

40 µl aliquots of PCR products generated as described above were purified using QIAquick™ PCR purification kit (Qiagen, USA) according to the manufacturer's instructions. The purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5. 25 µl of the purified PCR fragment was digested with BamHI and NotI, subjected to electrophoresis in 1.5% low gelling temperature agarose (SeaPlaque™ GTG, FMC) gels, and the relevant fragment was excised from the gels and purified using QIAquick™ Gel extraction kit (Qiagen, USA) according to the manufacturer's instructions. The isolated DNA fragment was then ligated to BamHI-NotI digested pMB335, and the ligation mixture was used to transform *E. coli* SJ2.

#### **Identification and characterization of positive clones**

30 Cells were plated on LB agar plates containing Ampicillin (200 µg/ml) and incubated at 37°C overnight. The next day, colonies were restreaked onto fresh LB-Ampicillin agar plates and incubated at 37°C overnight. The following day, single

colonies were transferred to liquid LB medium containing Ampicillin (200 µg/ml) and incubated overnight at 37°C with shaking at 250 rpm.

5 Plasmids were extracted from the liquid cultures using QIAgen Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. 5 µl samples of the plasmids were digested with BamHI and NotI. The digestions were checked by gel electrophoresis on a 1.5% agarose gel (NuSieve™, FMC). The appearance of a DNA fragment of the same  
10 size as seen from the PCR amplification indicated a positive clone.

One positive clone, containing the fusion construct of the  
15 Termamyl™ α-amylase gene and the CBD of *Bacillus agaradherens* NCIMB 40482 alkaline cellulase Cel5A, was designated MBamyC5A.

#### 20 **Cloning of the fusion construct into a *Bacillus*-based expression vector**

As mentioned previously, the amyL gene of *B. licheniformis* (contained in the pDN1528 vector) is actively expressed in *B. subtilis*, resulting in the production of active α-amylase appearing in the supernatant. For expression purposes, the  
25 DNA encoding the fusion protein as constructed above was introduced to pDN1528. This was done by digesting pMBamyC5A and pDN1528 with SalI-NotI, purifying the fragments and ligating the 4.7 kb pDN1528 SalI-NotI fragment with the 0.5 kb pMBamyC5A SalI-NotI fragment. This created an inframe  
30 fusion of the hybrid construction with the Termamyl™ gene. The DNA sequence of the fusion construction of pMB378, and the corresponding amino acid sequence, are shown in SEQ ID No. 5 and SEQ ID No. 6, respectively.

The ligation mixture was used to transform competent cells of *B. subtilis* PL2306. Cells were plated on LB agar plates containing chloramphenicol (6 µg/ml), 0.4% glucose and 10mM potassium hydrogen phosphate, and incubated at 37°C overnight. The next day, colonies were restreaked onto fresh LBPG chloramphenicol agar plates and incubated at 37°C overnight. The following day, single colonies of each clone were transferred to liquid LB medium containing chloramphenicol (6 µg/ml) and incubated overnight at 37°C with shaking at 250 rpm.

Plasmids were extracted from the liquid cultures using QIAGEN Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. However, the resuspension buffer was supplemented with 1 mg/ml of chicken egg white lysozyme (SIGMA, USA) prior to lysing the cells at 37°C for 15 minutes. 5 µl samples of the plasmids were digested with BamHI and NotI. The digestions were checked by gel electrophoresis on a 1.5% agarose gel (NuSieve™, FMC). The appearance of a DNA fragment of the same size as seen from the PCR amplification indicated a positive clone. One positive clone was designated MB378.

## **25 Expression, secretion and functional analysis of the fusion protein**

The clone MB378 (expressing Termamyl™ fused to *Bacillus agaradherens* Cel5A CBD) was incubated for 20 hours in SB medium at 37°C with shaking at 250 rpm. 1 ml of cell-free supernatant was mixed with 200 µl of 10% Avicel™. The mixture was incubated for 1 hour at 0°C and then centrifuged for 5 minutes at 5000 x g. The pellet was resuspended in 100 µl of SDS-PAGE buffer, and the suspension was boiled at 95°C

for 5 minutes, centrifuged at 5000 x g for 5 minutes, and 25  $\mu$ l was loaded onto a 4-20% Laemmli Tris-Glycine, SDS-PAGE NOVEX™ gel (Novex, USA). The samples were subjected to electrophoresis in an Xcell™ Mini-Cell (NOVEX, USA) as recommended by the manufacturer. All subsequent handling of gels, including staining (Coomassie), destaining and drying, were performed as described by the manufacturer.

The appearance of a protein band of molecular weight approx. 60 kDa indicated expression in *B. subtilis* of the Termamyl™-CBD fusion encoded on the plasmid pMB378.

### EXAMPLE 3

This example describes fusion of Termamyl™ and the CBD from *Cellulomonas fimi* (ATCC484) *cenA* gene using the sequence overlap extension (SOE) procedure [see, e.g., Sambrook et al., Ausubel et al., or C.R. Harwood and S.M. Cutting (loc. cit.)]. The final construction is as follows: Termamyl™ promoter - Termamyl™ signal peptide - *cenA* CBD - linker - mature Termamyl™.

#### Amplification of the Termamyl™ fragment for SOE

Approximately 10-20 ng of plasmid pDN1528 was PCR amplified in HiFidelity™ PCR buffer (Boehringer Mannheim, Germany) supplemented with 200  $\mu$ M of each dNTP, 2.6 units of HiFidelity™ Expand enzyme mix, and 100 pmol of each primer:

#4576

5'-CTC GTC CCA ATC GGT TCC GTC -3'

#28403

5'-TGC ACT GGT ACA GTT CCT ACA ACT AGT CCT ACA CGT GCA AAT  
CTT AAT GGG ACG CTG -3'

- 5 The part of the primer #28403 constituting a fragment of the Termamyl™ sequence is underlined. The sequence on the 5' side of this underlined sequence is that coding for the linker region to the CBD.
- 10 The PCR reaction was performed using a DNA thermal cycler (Landgraf, Germany). One incubation at 94°C for 2 min, 55°C for 30 sec and 72°C for 45 sec was followed by twenty cycles of PCR performed using a cycle profile of denaturation at 96°C for 10 sec, annealing at 55°C for 30 sec, and extension
- 15 at 72°C for 45 sec. 10 µl aliquots of the amplification product were analyzed by electrophoresis in 1.0 % agarose gels (NuSieve™, FMC) with ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size marker.
- 20 40 µl aliquots of the PCR product generated as described above were purified using QIAquick™ PCR purification kit (Qiagen, USA) according to the manufacturer's instructions. The purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5.
- 25 **Isolation of genomic DNA**
- Cellulomonas fimi* ATCC484 was grown in TY medium at 30°C with shaking at 250 rpm for 24 hours. Cells were harvested by centrifugation.
- 30 Genomic DNA was isolated as described by Pitcher et al., Lett. Appl. Microbiol. 8 (1989), pp. 151-156.

**In vitro amplification of the CBD of *Cellulomonas fimi*  
(ATCC484) *cenA* gene for SOE procedure**

Approximately 100-200 ng of genomic DNA was PCR amplified in HiFidelity™ PCR buffer (Boehringer Mannheim, Germany)

- 5 supplemented with 200 µM of each dNTP, 2.6 units of HiFidelity™ Expand enzyme mix, and 100 pmol of each primer:

#8828

5'-CTG CCT CAT TCT GCA GCA GCG GCG GCA AAT CTT AAT GCT CCC  
10 GGC TGC CGC GTC GAC TAC -3'

#28404

5'-TGT AGG AAC TGT ACC AGT GCA CGT GGT GCC GTT GAG C -3'

- 15 (PstI restriction site underlined).

The primers were designed to amplify the DNA encoding the cellulose-binding domain of the *CenA*-encoding gene of *Cellulomonas fimi* (ATCC484). The DNA sequence was extracted  
20 from the database GenBank under the accession number M15823.

PCR cycling was performed as follows: One incubation at 94°C for 2 min, 55°C for 30 sec and 72°C for 45 sec was followed by thirty cycles of PCR performed using a cycle profile of  
25 denaturation at 96°C for 10 sec, annealing at 55°C for 30 sec, and extension at 72°C for 45 sec. 10 µl aliquots of the amplification product were analyzed by electrophoresis in 1.0 % agarose gels (NuSieve™, FMC) with ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size marker.

30

40 µl aliquots of the PCR product generated as described above were purified using QIAquick™ PCR purification kit (Qiagen, USA) according to the manufacturer's instructions.

The purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5.

**SOE of the CBD from *Cellulomonas fimi* (ATCC484) *cenA* gene and the Termamyl™ gene**

Approximately 100-200 ng of the PCR amplified Termamyl™ fragment and the PCR amplified *cenA* CBD fragment were used in a second round of PCR. SOE of the two fragments was performed in

in HiFidelity™ PCR buffer (Boehringer Mannheim, Germany) supplemented with 200 µM of each dNTP, 2.6 units of HiFidelity™ Expand enzyme mix.

A touch-down PCR cycling was performed as follows: One incubation at 96°C for 2 min, 60°C for 2 min and 72°C for 45 sec. This cycle was repeated ten times with a 1°C decrease of the annealing temperature at each cycle.

A third PCR reaction was started by adding 100 pmol of the two flanking primers #8828 and #4576 (*vide supra*) to amplify the hybrid DNA. PCR was performed by incubating the SOE reaction mixture at 96°C for 2 min, 55°C for 30 sec and 72°C for 45 sec. This was followed by twenty cycles of PCR performed using a cycle profile of denaturation at 96°C for 10 sec, annealing at 55°C for 30 sec, and extension at 72°C for 45 sec. 10 µl aliquots of the amplification product were analyzed by electrophoresis in 1.0 % agarose gels (NuSieve™, FMC) with ReadyLoad™ 100bp DNA ladder (GibcoBRL, Denmark) as a size marker. The SOE fragment had the expected size of 879 bp.

**Subcloning of the SOE fragment coding for the CBD-Termamyl**

**hybrid**

40 µl of the SOE-PCR product generated as described above was purified using QIAquick™ PCR purification kit (Qiagen, USA) according to the manufacturer's instructions. The purified DNA was eluted in 50 µl of 10mM Tris-HCl, pH 8.5. 25 µl of the purified PCR fragment was digested with PstI and KpnI, subjected to electrophoresis in 1.0% low gelling temperature agarose (SeaPlaque™ GTG, FMC) gels, and a fragment of 837 bp was excised from the gel and purified using QIAquick™ Gel extraction Kit (Qiagen, USA) according to the manufacturer's instructions. The isolated DNA fragment was then ligated to PstI- and KpnI-digested pDN1981, and the ligation mixture was used to transform competent cells of *B. subtilis* PL2306. Cells were plated on LB agar plates containing Kanamycin (10 µg/ml), 0.4% glucose and 10mM potassium hydrogen phosphate, and incubated at 37°C overnight. The next day, colonies were restreaked onto fresh LBPG Kanamycin agar plates and incubated at 37°C overnight. The following day, single colonies of each clone were transferred to liquid LB medium containing Kanamycin (10 µg/ml) and incubated overnight at 37°C with shaking at 250 rpm.

Plasmids were extracted from the liquid cultures using QIAGEN Plasmid Purification mini kit (Qiagen, USA) according to the manufacturer's instructions. However, the resuspension buffer was supplemented with 1 mg/ml of chicken egg white lysozyme (SIGMA, USA) prior to lysing the cells at 37°C for 15 minutes. 5 µl samples of the plasmids were digested with PstI and KpnI. The digestions were checked by gel electrophoresis on a 1.5% agarose gel (NuSieve™, FMC). The appearance of a DNA fragment of 837 bp, the same size as seen from the PCR amplification, indicated a positive clone. One positive clone was designated MOL1297.

### Expression, secretion and functional analysis of the fusion protein

The clone MOL1297 (expressing *C. fimi* *cenA* CBD fused to the N-terminal of Termamyl™) was incubated for 20 hours in SB medium at 37°C with shaking at 250 rpm. 1 ml of cell-free supernatant was mixed with 200 µl of 10% Avicel™. The mixture was incubated for 1 hour at 0°C and then centrifuged for 5 min at 5000 x g. The pellet was resuspended in 100 µl of SDS-PAGE buffer, boiled at 95°C for 5 minutes, centrifuged at 5000 x g for 5 minutes, and 25 µl was loaded on a 4-20% Laemmli Tris-Glycine, SDS-PAGE NOVEX gel (Novex, USA). The samples were subjected to electrophoresis in an Xcell™ Mini-Cell (NOVEX, USA) as recommended by the manufacturer. All subsequent handling of gels including staining (Coomassie), destaining and drying, was performed as described by the manufacturer.

The appearance of a protein band of MW approx. 85 kDa indicated expression in *B. subtilis* of the CBD-Termamyl™ fusion.

The encoding sequence for the *C. fimi* *cenA* CBD-Termamyl hybrid is shown in SEQ ID No. 7 (in which lower case letters indicate the CBD-encoding part of the sequence). The corresponding amino acid sequence of the hybrid is shown in SEQ ID No. 8 (in which lower case letters indicate the CBD amino acid sequence).

### EXAMPLE 4

This example describes the construction of fusion proteins (enzyme hybrid) from a lipase (Lipolase™; *Humicola*

lanuginosa lipase) and a CBD. A construction with an N-terminal CBD was chosen, since the N-terminal of the enzyme is far from the active site, whereas the C-terminal is in relatively close proximity to the active site.

5

#### **pIVI450 construction (CBD-linker-lipase)**

This construct was made in order to express a protein having the *Myceliophthora thermophila* cellulase CBD and linker at the N-terminal of Lipolase™.

10

A PCR fragment was created using the clone pA2C161 (DSM 9967) containing the *M. thermophila* cellulase gene as template, and the following oligomers as primers:

15

#8202

5' ACGTAGTGGCCACGCTAGGCGAGGTGGTGG 3'

#19672

5' CCACACTTCTCTTCCTTCCTC 3'

20

The PCR fragment was cut with BamHI and BalI, and cloned into pAHL which was also cut with BamHI and BalI just upstream of the presumed signal peptide processing site. The cloning was verified by sequencing (see SEQ ID No. 9).

25

#### **Removing linker between CBD and lipase**

This construct is made so that any linker of interest can be inserted between the CBD and the lipase in order to find an optimal linker.

30

An NheI site is introduced by the USE technique (Stratagene catalogue No. 200509) between the CBD and linker region in pIVI450, creating pIVI450+NheI site. pIVI450+NheI site is cut with XhoI and NheI, isolating the vector containing the

CBD part.

The plasmid pIVI392 is cut with XhoI and NheI, and the  
fragment containing the Lipolase™ gene (minus signal peptide  
5 encoding sequence) is isolated.

The DNA fragments are ligated, generating pIVI450 CBD-NheI  
site-Lipolase™ containing an NheI site between the CBD and  
the lipase gene. In this NheI site different linkers can be  
10 introduced.

#### **Introduction of non-glycosylated linker**

The protein expressed from the construct described here  
contains a construction of the type:

15 CBD-nonglycosylated linker-lipase.

The amino acid sequence of the linker is as follows:

NNNPQQGNPNQGGNNGGNGQGGGNGG

20 PCR is performed with the following primers:

#29315

5' GATCTAGCTAGCAACAATAACCCCCAGCAGGGCAACCCCAACCAGGGC  
25 GGGAACAACGGC 3'

#29316

5' GATCTAGCTAGCGCCGCGTGTGCCGCGCCCTGGTTGCCGCGCCGTT  
30 GTTCCCGCCCTG 3'

The PCR fragment is cut with NheI, the vector pIVI450 CBD-  
NheI-Lipolase™ is likewise cut with NheI, and the two  
fragments are ligated, creating:  
pIVI450 CBD-Nonglycosylated linker-Lipolase™ (SEQ ID No.

10).

#### Introduction of *H. insolens* family 45 cellulase linker

The protein expressed from the construct described here  
5 contains a construction of the type:  
CBD-glycosylated linker-lipase.

The amino acid sequence of the linker is as follows:

10 VQIPSSSTSSPVNQPTSTSTTSTTSSPPVQPTTPS

PCR is performed with the following primers:

#29313

15 5' GATACTGCTAGCGTCCAGATCCCCTCCAGC 3'

#29314

5' GATACTGCTAGCGCTGGGAGTCGTAGGCTG 3'

20 The PCR fragment is cut with *Nhe*I, the vector pIVI450 CBD-  
*Nhe*I-Lipolase™ is likewise cut with *Nhe*I, and the two  
fragments are ligated, creating:

pIVI450 CBD-*H. insolens* family 45 cellulase linker-Lipolase™  
(SEQ ID No. 11).

25

#### EXAMPLE 5

This example concerns fusion proteins comprising a CBD linked  
to *Coprinus cinereus* peroxidase (CiP) or to a mutant thereof  
30 (mCiP842) (see, e.g., WO 95/10602).

#### Yeast expression system

The pJC106/YNG344 host/vector system was chosen as the  
standard expression system for all CiP experiments utilizing

yeast expression. Mutant mCiP842 contains the following amino acid substitutions relative to the parent CiP: V53A, E239G, Y272F, M242I. Constructions using this plasmid were performed with the same procedure as was used for the fusion of CBD to the wild type CiP gene.

**Construction of the CBD-CiP fusion vector JC20A or JC20D: CiP signal seq.-*H. insolens* family 45 cellulase CBD- *H. insolens* family 45 cellulase linker-CiP or -mCiP842**

- 10 The CBD-CiP fusion was constructed by amplifying four separate gene fragments using PCR. A) The CiP 5'-untranslated region and the CiP coding sequence from plasmid JC106 or mCiP842 encoding amino acids 1 to 22, B) the *H. insolens* family 45 cellulase CBD from plasmid pCaHj418 encoding amino acids 248-305, C) the *H. insolens* family 45 cellulase linker domain from plasmid pCaHj418 encoding amino acids 213-247, and D) the CiP coding sequence from plasmid JC106 or mCiP842 encoding amino acids 21 to 344.
- 15
- 20 The sequence of the *H. insolens* family 45 cellulase is disclosed in WO 91/17244.

Primers used in amplifications A through D were as follows:

25 Amplification A:

1. CiPpcrdwn: CCCCTTCCCTGGCGAATTCCGCATGAGG
2. JC20.1: ACCTTGGGGTAGAGCGAGGGCACCGATG

Amplification B:

3. JC20.2: TGCCTGCTGAGAGGTGGGC
- 30 4. JC20.3: CAGGCACTGATGATACCACT

Amplification C:

5. JC20.4: CCCTCCAGCAGCACCAGCTCT
6. JC20.5: TCCTCCAGGACCCTGACCGCTCGGAGTCGTAGGCTG

Amplification D:

7. JC20.6: TACGACTCCGAGCGGTCAGGGTCCTGGAGGAGGCGGG

8. YES2term: GGGAGGGCGTGAATGTAAG

Amplified products of reactions A) and B) were purified and phosphorylated using T4 polynucleotide kinase, ligated to one another for 15 min. at room temperature, and amplified with primers 1 and 4 to generate product AB. Amplified products of reactions C) and D) were purified and mixed, then PCR-amplified to generate product CD. Reaction products AB and CD were purified and phosphorylated using T4 polynucleotide kinase, ligated to one another for 15 min. at room temperature, and amplified with primers 1 and 8 to generate the final product. The resulting product was purified, mixed with plasmid JC106 which had the CiP gene removed by digestion with BamHI and XhoI. Plasmid JC20A contains the wild type CiP gene, whereas plasmid JC20D contains the peroxide-stable mutant mCiP842. Transformants were selected on minimal media lacking uridine.

**Construction of the other CBD-CiP fusion vectors JC21, 22, 23**  
Other plasmids containing alternate linkers between the *H. insolens* family 45 cellulase CBD and CiP were constructed in essentially the same way as described for plasmid JC20A above, using PCR and overlap extension. The resulting plasmids encode fusion proteins with the following domain compositions:

JC21: CiP signal seq.-truncated *H. insolens* family 45 cellulase CBD-*H. insolens* family 45 cellulase linker-CiP

JC22: CiP signal seq.-*H. insolens* family 45 cellulase CBD-linker from the NifA gene of *Klebsiella pneumoniae*-CiP

JC23: CiP signal seq.-*H. insolens* family 45 cellulase CBD-

linker from the E. coli OmpA gene-CiP.

#### Scoring of transformants for peroxidase and cellulose-binding activity

5 Plate Assay: Yeast transformants were grown on minimal media plates containing 2% galactose (to induce the GAL1 yeast promoter driving CBD-CiP expression) that had been covered with a double filter layer consisting of cellulose acetate on top of nitrocellulose. After overnight growth,  
10 both filters were washed twice with 100 ml of 20 mM phosphate buffer, pH 7.0 for 5 minutes, after which no colony debris could be detected. Filters were then assayed for bound peroxidase activity by coating them with a 100 mM phosphate buffer, pH 7.0, containing 50 µg/ml of diamino-benzidine and  
15 1 mM hydrogen peroxide. Bound peroxidase activity appears as a brown precipitate on the filter.

Liquid Assay: Liquid cultures of mutants demonstrating cellulose binding in the filter assay were grown overnight in  
20 minimal media containing 2% galactose. 20 µl samples of culture broth were mixed with Avicel crystalline cellulose (20 g/L) in 0.1 M phosphate buffer, pH 7, 0.01% Tween 20 in a total volume of 100 µl and incubated at 22°C for 10 minutes. The mixture was then centrifuged to pellet the  
25 insoluble cellulose fraction, and the supernatants were assayed for peroxidase activity using the standard CiP assay (see, e.g, WO 95/10602). Binding was scored as the % activity bound to the insoluble cellulose fraction based on the decrease in soluble activity.

30

#### High pH/thermal stability screening of CBD-CiP fusions

This screening process utilizes broth samples from yeast cultures grown in microtiter plates. The 96-well plate screen is performed by first growing yeast transformants of a pool

of mutants in 50  $\mu$ L volumes of URA(-) medium, pH 6.0 in 96-well microtiter plates. Cultures are inoculated by dilution into medium and pipetting (robotic or manual autopipettor) into 96-well plates. These are placed in an incubator set at  
5 30°C, 350 RPM and shaken for approximately 5 days. Plates are placed directly from the culture box onto the robotic system.

Both CiP and mCiP842 and the related fusion proteins were  
10 subjected to a combined pH - temperature -  $H_2O_2$  stress test: After an initial activity assay, cultures are diluted to ca. 0.06 PODU/ml (see WO 95/10602 for definition of PODU) and incubated in 200  $\mu$ M hydrogen peroxide, 100mM phosphate/borate buffer, pH10.5 at 50° C. After 0, 10, 20 and 30 minutes,  
15 samples are removed and residual activity is measured using the standard ABTS assay, pH 7.0. Improved mutants are those showing higher residual activity than CiP and are expressed as percent residual activity relative to the time 0 assay result.

20 Yeast expression plasmids designed to make five *H. insolens* family 45 cellulase CBD-CiP fusions were constructed and sequenced. The primary difference between the fusions is in the type of linker domain that connects the CBD to the CiP,  
25 as this was thought to be important for maximizing the binding of the CBD to cellulosic substrates.

All the constructs encode a fusion of four discrete domains: CiP signal sequence-*H. insolens* family 45 cellulase CBD-  
30 linker-CiP. Plasmid JC20A is a CBD-CiP fusion to the wild type CiP, while plasmid JC20D is a fusion to the stable mutant mCiP842 containing the amino acid substitutions V53A, E239G, M242I and Y272F. Both JC20 constructs contain the natural *H. insolens* family 45 cellulase linker domain.

Plasmid JC21 encodes a fusion protein identical to the JC20 product with the exception that it contains a truncated linker lacking residues 7 to 23 of the *H. insolens* family 45 cellulase linker. Plasmid JC22 has the *H. insolens* family 45  
5 cellulase linker domain replaced with a 12 residue proline-rich linker from the outer membrane protein of *E. coli* (from the OmpA gene). The final plasmid, JC23, contains a fourth linker (called a Q linker) derived from the NifA gene of *Klebsiella pneumoniae*. This linker, 14 amino acids in  
10 length, contains 3 glutamine residues (hence the name Q linker) as well as 3 arginine residues, giving it a positive charge at neutral pH.

These JC20-series plasmids were transformed into *S. cerevisiae*  
15 for expression and testing. After transformation, yeast colonies were grown on selective plates covered with a double filter layer: cellulose acetate filters on top of nitrocellulose. Wild type CiP secreted from yeast JC106 and the stable mutant mCiP842 pass through the cellulose acetate,  
20 then binds to the nitrocellulose where it can be visualized using diaminobenzidine (DAB) and  $H_2O_2$ . The cellulose acetate filter does not bind any wild-type or mCiP842 peroxidase. In contrast, the N-terminal CBD-CiP fusions encoded by plasmids JC20A, JC20D, JC21, JC22, and JC23 are all detectable on  
25 both filters using the DAB assay, indicating that the fusion proteins have both peroxidase and cellulose-binding activities. Visual inspection of filters suggests that the NifA linker may improve binding slightly over the others, although the difference is marginal. In all cases the  
30 peroxidase activity bound to the cellulose acetate filter remains bound even after washing extensively with buffer at pH 7. The activity bound to the lower nitrocellulose filter suggests that binding of the CBD-CiP may be incomplete, or the cellulose filter gets saturated, allowing some of the

fusion protein to pass through to the lower filter, or that some percentage of the fusion protein gets truncated to include only the peroxidase domain.

- 5 Sequence identifiers herein corresponding to the constructs are as indicated below. Abbreviations are as follows:

EGV: *Humicola insolens* family 45 endoglucanase (cellulase)

CiPss: CiP signal sequence

- 10 CiP842: CiP mutant/variant mCiP842;

SEQ ID No. 12: Nucleotide sequence of the CiPss(+ 2 amino acids)-EGV CBD-EGV linker-CiP fusion in JC20.A;

- 15 SEQ ID No.13: Nucleotide sequence of the CiPss(+ 2 amino acids)-EGV CBD-EGV linker-CiP842 fusion in JC20.D1;

SEQ ID NO. 14: Nucleotide sequence of the CiPss(+ 2 amino acids)-EGV CBD-truncated EGV linker-CiP fusion in JC21;

20

SEQ ID No. 15: Nucleotide sequence of the CiPss(+ 2 amino acids)-EGV CBD-*E. coli* OmpA linker-CiP fusion in JC22;

- 25 SEQ ID No. 16: Nucleotide sequence of the CiPss(+ 2 amino acids)-EGV CBD-NifA linker- CiP fusion in JC23.

#### EXAMPLE 6

- 30 This example concerns fusion proteins comprising a CBD linked to *Myceliophthora thermophila* laccase (MtL) (MtL is described in, e.g., WO 95/33836).

**Construction of the N-terminal MtL-CBD fusion pJC24**

A DNA fragment containing the *Coprinus cinereus* peroxidase (CiP) signal sequence (22 amino acids), the *H. insolens* family 45 cellulase CBD (37 amino acids) and a NifA linker domain from *Klebsiella pneumoniae* (14 amino acids) was PCR-amplified using two  
5 specific primers to plasmid pJC23.

<u>primer name</u>	<u>sequence</u>
CiPpcrdwn:	CTGGGGTAATTAATCAGCGAAGCGATG
JC24.1	AGCGCGTGGACGTTTCGATGC

10

PCR amplification was performed using Pwo polymerase (Boehringer Mannheim) using the supplied buffer according to the manufacturer's instructions. The reaction was initiated after 3 min. at 96°C by addition of the polymerase, and allowed to cycle  
15 30 times with 30 sec at 96°C, 30 sec at 60°C and 2 min at 72°C. A second PCR fragment encoding the mature MtL peptide lacking both the signal peptide and propeptide (residues 48-620) was PCR amplified from a cDNA clone of the *Myceliophthora* laccase contained in plasmid pJRoC30. PCR amplification was performed  
20 using the same conditions as described above and the following primer pair:

<u>primer name</u>	<u>sequence</u>
JC24.2	CAGCAGAGCTGCAACACCCCCAG
25 YES2term	GGGGAGGGCGTGAATGTAAG

Following amplification, both DNA fragments were purified using the QiaQuick™ Spin purification kit (Qiagen, Inc.) according to the manufacturer's recommendations. The two DNA fragments were  
30 then ligated together and a portion of the ligation mix used as a template for PCR amplification using the CiPpcrdwn and YES2term primers under the same conditions as described above. The resulting 2.3 kb chimeric DNA fragment was gel-purified, cut with BamHI and NotI restriction enzymes, and ligated into the vector

backbone of plasmid pJC106 to obtain plasmid pJC24.

#### Construction of the C-terminal MtL-CBD fusion pJC25

A PCR fragment encoding the entire MtL peptide (residues 1-620)  
5 and 232 bp of upstream sequence was amplified from plasmid pJRoC30  
using the following primer pair:

	<u>primer name</u>	<u>sequence</u>
	CiPpcrdwn:	CTGGGGTAATTAATCAGCGAAGCGATG
10	JC25.2	CGCCTTGACCAGCCACTCGCCCTCCTCG

A second DNA fragment encoding the *H. insolens* family 45  
cellulase linker domain (35 amino acids), the *H. insolens*  
family 45 cellulase CBD (37 amino acids) and 20 bp of 3' non-  
15 coding sequence was amplified from the *H. insolens* family 45  
cellulase plasmid pCaHj418 using the following primer pair:

	<u>primer name</u>	<u>sequence</u>
	JC20.4	CCCTCCAGCAGCACCAGCTCTC
20	JC25.1NotI	ATAAGAATGCGGCCGCTACAGGCACTGATGGTACCACT

The two DNA fragments were ligated briefly and the full-  
length 2.3 kb fusion product was amplified as described  
above, using the primers CiPpcrdwn and JC25.1NotI. This  
25 final PCR product was cloned into plasmid pJC106 to obtain  
plasmid pJC25.

#### Construction of the C-terminal MtL-CBD fusion pJC26

Plasmid pJC26 was constructed in exactly the same manner as  
30 pJC25, except that primer ML-ct was substituted for primer  
JC25.1 and resulted in a truncated product of the MtL gene  
lacking the final 17 codons.

	<u>primer name</u>	<u>sequence</u>
--	--------------------	-----------------

ML-ct

CAGCAGAGCTGCAACACC

Sequence identifiers herein corresponding to the constructs  
5 are as as indicated below. Abbreviations are as follows:

EGV: *Humicola insolens* family 45 endoglucanase (cellulase)

CiPss: CiP signal sequence

MtLss: MtL signal sequence

10

SEQ ID No. 17: Nucleotide sequence of the CiPss(+ 2 amino  
acids)-EGV CBD-NifA linker-MtL fusion in pJC24;

15

SEQ ID No. 18: Nucleotide sequence of the MtLss-MtL  
propeptide-MtL-EGV linker-EGV CBD fusion in pJC25;

20

SEQ ID No. 19: Nucleotide sequence of the MtLss-MtL  
propeptide-MtL (minus 17 amino acids)-EGV linker-EGV CBD  
fusion in pJC26. The codons corresponding to the 17 amino  
acids in question are shown in bold in SEQ ID No. 18.

## SEQUENCE LISTING

## (1) GENERAL INFORMATION:

## (i) APPLICANT:

(A) NAME: NOVO NORDISK A/S  
(B) STREET: Novo Alle  
(C) CITY: Bagsvaerd  
(E) COUNTRY: Denmark  
(F) POSTAL CODE (ZIP): DK-2880  
(G) TELEPHONE: +45 44 44 88 88  
(H) TELEFAX: +45 44 49 32 56

(ii) TITLE OF INVENTION: PROCESS FOR REMOVAL OR BLEACHING OF SOILING  
OR STAINS FROM CELLULOSIC FABRIC

(iii) NUMBER OF SEQUENCES: 6

## (iv) COMPUTER READABLE FORM:

(A) MEDIUM TYPE: Floppy disk  
(B) COMPUTER: IBM PC compatible  
(C) OPERATING SYSTEM: PC-DOS/MS-DOS  
(D) SOFTWARE: PatentIn Release #1.0, Version #1.30 (EPO)

## (2) INFORMATION FOR SEQ ID NO: 1:

## (i) SEQUENCE CHARACTERISTICS:

(A) LENGTH: 2253 base pairs  
(B) TYPE: nucleic acid  
(C) STRANDEDNESS: single  
(D) TOPOLOGY: linear

(ii) MOLECULE TYPE: DNA (genomic)

## CLAIMS

1. A process for removal or bleaching of soiling or stains present on cellulosic fabric, wherein the fabric is contacted  
5 in aqueous medium with a modified enzyme (enzyme hybrid) which comprises a catalytically active amino acid sequence of a non-cellulolytic enzyme linked to an amino acid sequence comprising a cellulose-binding domain.
- 10 2. A process according to claim 1, wherein said soiling or stain originates from starch, protein, fat, soil, clay, fruit, vegetables, coffee, tea, spices, red wine, body fluids, grass or ink.
- 15 3. A process according to claim 1, wherein said catalytically active amino acid sequence derives from an enzyme selected from the group consisting of amylases, proteases, lipases, pectinases and oxidoreductases.
- 20 4. A process according to claim 3, wherein said amylase is an  $\alpha$ -amylase obtainable from a species of *Bacillus*.
5. A process according to claim 3 or 4, wherein said  $\alpha$ -amylase is obtainable from *Bacillus licheniformis*.
- 25 6. A process according to claim 3, wherein said protease is obtainable from a species of *Bacillus* or *Fusarium*.
7. A process according to claim 3, wherein said lipase is  
30 obtainable from a species of *Humicola*, *Candida*, *Pseudomonas* or *Bacillus*.
8. A process according to claim 3, wherein said oxidoreductase is a peroxidase or a laccase.

9. A process according to claim 8, wherein said peroxidase is obtainable from a species of *Coprinus*.

5 10. A process according to claim 8 or 9, wherein said peroxidase is obtainable from *C. cinereus*.

11. A process according to claim 8, wherein said laccase is obtainable from a species of *Trametes*, *Myceliophthora*, *Schytalidium* or *Polyporus*.  
10

12. A process according to claim 1, wherein said cellulose-binding domain is obtainable from a cellulase, a xylanase, a mannanase, an arabinofuranosidase, an acetylcetase or a chitinase.  
15

13. A process according to claim 1, wherein said enzyme hybrid is obtained by a method comprising growing a transformed host cell containing an expression cassette which comprises a DNA sequence encoding said enzyme hybrid, whereby said enzyme hybrid is expressed.  
20

14. A detergent composition comprising:

25 an enzyme hybrid which comprises a catalytically active amino acid sequence of a non-cellulolytic enzyme linked to an amino acid sequence comprising a cellulose-binding domain, and

30 a surfactant.

15. A process for washing soiled or stained cellulosic fabric, wherein said fabric is washed in an aqueous medium to which is added a detergent composition according to claim 14.

16. An enzyme hybrid encoded by a hybrid-encoding DNA sequence comprised within the DNA sequences of SEQ ID No. 1, SEQ ID No. 3, SEQ ID No. 5, SEQ ID No. 7, SEQ ID No. 9, SEQ ID No. 10, SEQ ID No. 11, SEQ ID No. 12, SEQ ID No. 13, SEQ ID No. 14, SEQ ID No. 15, SEQ ID No. 16, SEQ ID No. 17, SEQ ID No. 18 or SEQ ID No. 19.

17. An enzyme hybrid having an amino acid sequence comprised within the amino acid sequences of SEQ ID No. 2, SEQ ID No. 4, SEQ ID No. 6 or SEQ ID No. 8.

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/DK 97/00042

## A. CLASSIFICATION OF SUBJECT MATTER

IPC6: C11D 3/386, C07K 19/00, C12N 9/00

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC6: C12N, C07K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

SE,DK,FI,NO classes as above

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

WPI, BIOSIS, CA, DBA, MEDLINE, PASCAL

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

☒ See patent family annex.

\* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art

"&" document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/DK 97/00042

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see next page

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐  
☐

The additional search fees were accompanied by the applicant's protest.

No protest accompanied the payment of additional search fees.

INTERNATIONAL SEARCH REPORT

International application No.

PCT/DK 97/00042

According to rule 13.2, an international application shall relate to one invention only or a group of inventions linked by one or more of the same or corresponding "special technical features", i.e. features that define a contribution which each of the inventions makes over prior art.

The claimed invention relates to a process for removal or bleaching of soiling on cellulosic fabric using a modified enzyme which comprises a catalytically amino acid sequence of a non cellulolytic enzyme linked to an amino acid sequence comprising a cellulose-binding domain. SEQ ID No. 3 of claim 16 and SEQ ID No 4 of claim 17 encodes an enzyme having cellulolytic activity, thus the present claims lack unity, *a priori*.

The application claims the following inventions:

Invention 1, claims 1-17: A process and related compositions and enzyme hybrids, for removal or bleaching of soiling on cellulosic fabric using a modified enzyme which comprises a catalytically amino acid sequence of a non cellulolytic enzyme linked to an amino acid sequence comprising a cellulose-binding domain.

Invention 2, claims 16 and 17: An enzyme hybrid encoded by SEQ ID No 3 having the amino acid sequence of SEQ ID No 4.

An additional fee has been paid, thus, an additional search has been performed.
